

THE MB IIB-CORPUS OF THE HYKSOS PERIOD AT TELL EL-DAB^{cA}

Karin Kopetzky¹

Well stratified pottery is one of the cornerstones of relative dating and one of the basics for an absolute chronology. Tell el-Dab^{cA}, situated in the north eastern Nile Delta, is in the fortunate position of having Egyptian and imported pottery from the Syro-Palestinian region and Cyprus in the same contexts.

At the beginning of the intensive contact with the Syro-Palestinian area, in the late 12th dynasty (str. H), nearly all of the MB vessels were imported to the site. While the import of these vessels continued in the early 13th dynasty, gradually the production of MB-vessels in Egyptian fabrics began and increased through this period. This resulted in a local tradition for the production of MB vessels, which had a typological development of its own. Nevertheless, during all these periods, new influences from the Syro-Palestinian region came to Tell el-Dab^{cA} and were transformed by local potters.

SOME GENERAL REMARKS ON THE MB-CORPUS OF TELL EL-DAB^{cA} IN THE HYKSOS PERIOD

The percentage of MB-shapes in the settlement layers of str. E/1 is approximately 24%, of which 7% are real imports and 17% are locally produced MB-vessels. 75% of these imports are Canaanite storage jars, while 25% belong to various other vessel types. In the tombs of str. E/2–E/1, 90% of the pottery repertoire comes from the MB-corpus.² In this transitional period, 25% of the pottery is imported, of which 44% are Canaanite storage jars and the remainder mainly juglets, carinated bowls or little bowls. This proportion changes in str. E/1 when 74% of the ceramic burial goods belong to the MB-corpus, but only 21% of

these shapes are imports to the site. Again, Canaanite storage jars are the main vessel types (86%), which were used as containers for child burials and only 14% of the imports are small vessels.

In str. D/3, 21% of the shapes belong to the MB-repertoire with 4% imports and 17% produced with Egyptian fabrics. Among the imports, 94% are Canaanite jars and only 6% belong to other vessel types. In the burials, 76% of the pottery continues to be of MB-shapes of which 34% were imported. Only 1% of the imports were juglets; the remainder are Canaanite jars.

At the end of the Hyksos period in str. D/2, 21% of the pottery in the settlement layers belong to the MB-corpus, of which 3% were imported and 18% made of Egyptian clays. The bulk of the imported material continue to be Canaanite jars (96%) and only 4% fall to other vessel types. In the looted tombs, 39% of the preserved pottery is from the MB-repertoire, of which 12% were imported and 27% produced locally. The main group of the imports are Canaanite jars with 75%, while 25% are of other MB-shapes.

The general trend during the Hyksos period is that the amount of MB-shapes in the ceramic corpus of TD declines from about 30 % at the beginning to about 20 % at the end of the period. The real imports from Syria-Palestine fall from about 5 % of the total pottery down to half the amount at the end of this time frame.

TELL EL-YAHUDIYEH JUGS AND JUGLETS

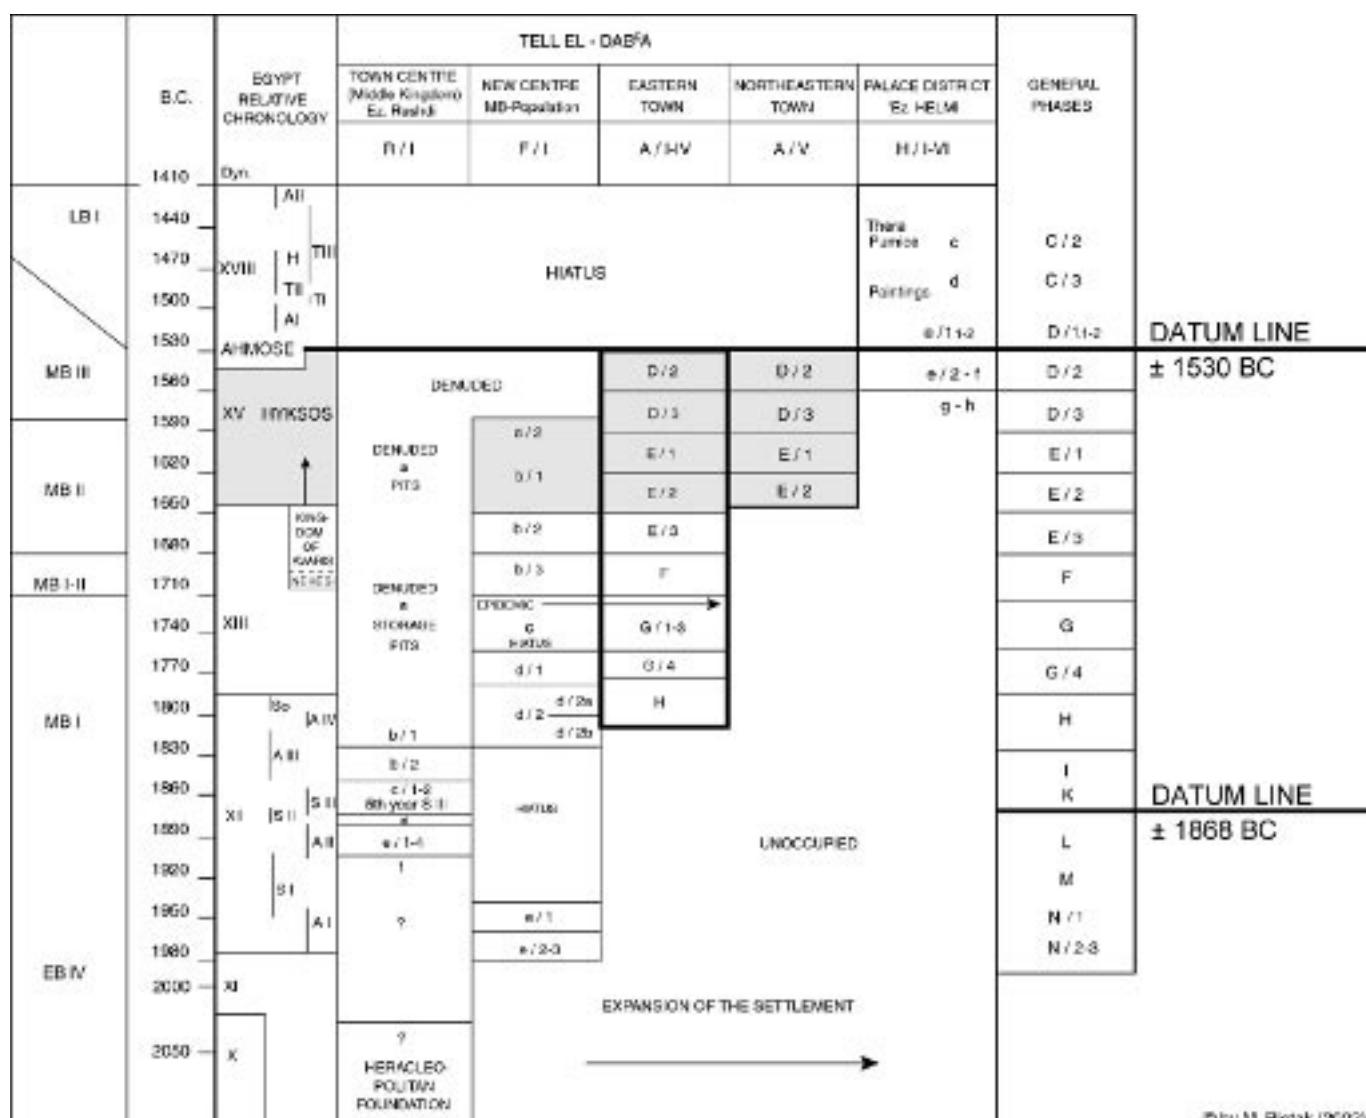

A well represented group of pottery at Tell el-Dab^{cA} is the so called Tell el-Yahudiyeh ware whose development has been thoroughly studied by M. Bietak.³

¹ Here I want to thank my colleagues Irene Forstner Müller, Irmgard Hein and Vera Müller, who generously allowed me to use their unpublished material for this study. It is to express that the dating of this material is based on their unpublished Ph.D.-theses and manuscripts. Furthermore I am much obliged to Manfred Bietak, who always encouraged and supported studies like this one to be done. For lively discussions I want to thank Ernst Czerny, Christa Mlinar and Robert Schiestl and finally for inking most of the drawings Eva Dobretsberger.

² Most of the burials in Tell el-Dab^{cA} have been looted and

only a small percentage were found intact. The older and therefore deeper in the ground the burials have been hidden, the higher the percentage of intact burials, i.e. in str. D/3 only 20 % of the burials were intact, while in str. D/2 every excavated brick built tomb has been robbed.

Fig. 1 The stratigraphy of Tell el-Dab'a

It is first documented as an import in str. G/4⁴ at the beginning of the 13th dynasty. While the early examples were imported to the site, those of the Hyksos period were all produced in Egyptian Nile clays.⁵ Of these, there are common features in all types of incrusted Tell el-Yahudiyyeh vessels. In the early and middle Hyksos period, the dominant fabric for the juglets is the I-d clay of the Tell el-Dab'a fabric system, while towards the end I-b-2 clay becomes more common. I-d is a fabric that was used exclusively for the production of MB-shapes. It is a fine Nile clay mixed with limestone particles. The earliest examples

from the end of the MBIIA / beginning of the MBIIIB period look – even under a microscope – so similar to Syro-Palestinian fabrics, that it seems as if the potters of Avaris not only wanted to copy the MB-shapes, but also the original fabric from which they were made. In time, this fabric developed more and more into a typical Nile clay in its outward appearance. One might consider this phenomenon as a decline of original traditions and a development towards locally established pottery schools with a tradition of their own. This is a phenomenon, which can also be observed in other shapes of the Hyksos

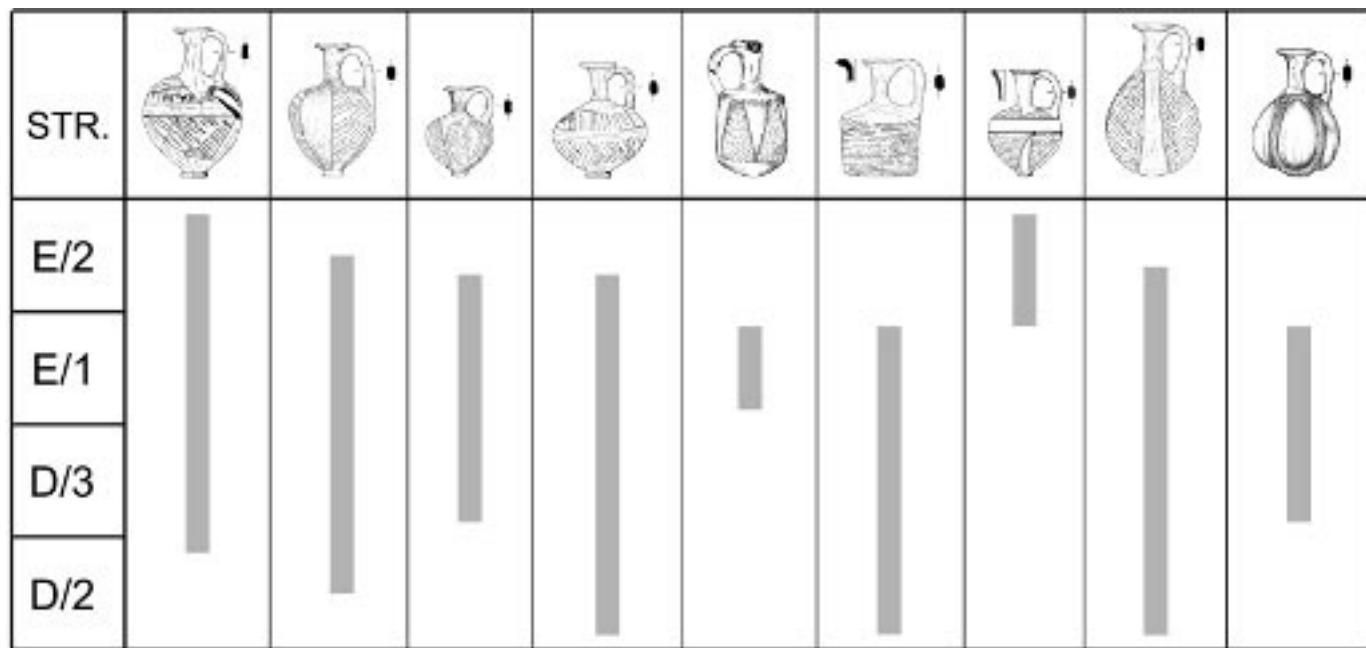

Fig. 2 Chronological appearance of Tell el-Yahudiye juglets

time leading to vessel types whose origin can be found in the MB-culture, but seems to develop into a pottery with a strong local touch.

In earlier periods, this type of juglet is either brown, red, or black burnished, or only burnished: in the Hyksos levels black burnishing is the only surviving surface treatment of these juglets. In addition, the positioning of the burnishing changes. In the earlier strata plain and incrusted pattern zones have been burnished while in the Hyksos strata only the plain pattern zones are burnished and the incrusted zones remained untreated.

Another trend is a general reduction in the size of these juglets compared to earlier phases, as well as a simplification of the rims and handles. Here only rims rolled to the outside and strap handles appear.⁶ Again, this might be a local phenomenon.

As M. Bietak has already stated in his article about *Egypt and Canaan during the Middle Bronze*

Age,⁷ the large-sized Tell el-Yahudiye jugs are found exclusively in settlement layers, while the smaller examples in most of the cases come from intra-mural burials. Many fragments of the latter ones have also been found in settlement layers. This can be explained on the one hand by the fact that nearly all the larger tombs of this period may have been looted soon after the burial. On the other hand, they must have existed in daily life as well, for in the same period they appear in settlement areas where no tombs have been found.

Piriform 1c juglets⁸ (Fig. 3/1, 4) with their standing and hanging triangle decoration, as well as the piriform 2a juglets⁹ (Fig. 3/2) with vertical segments, have their forerunners already in earlier levels.¹⁰ While the normal sized piriform juglets with the vertical segments and the biconical ones with an upper and lower incrusted zone (Fig. 3/3, 6) are quite common during the whole Hyksos period, their smaller

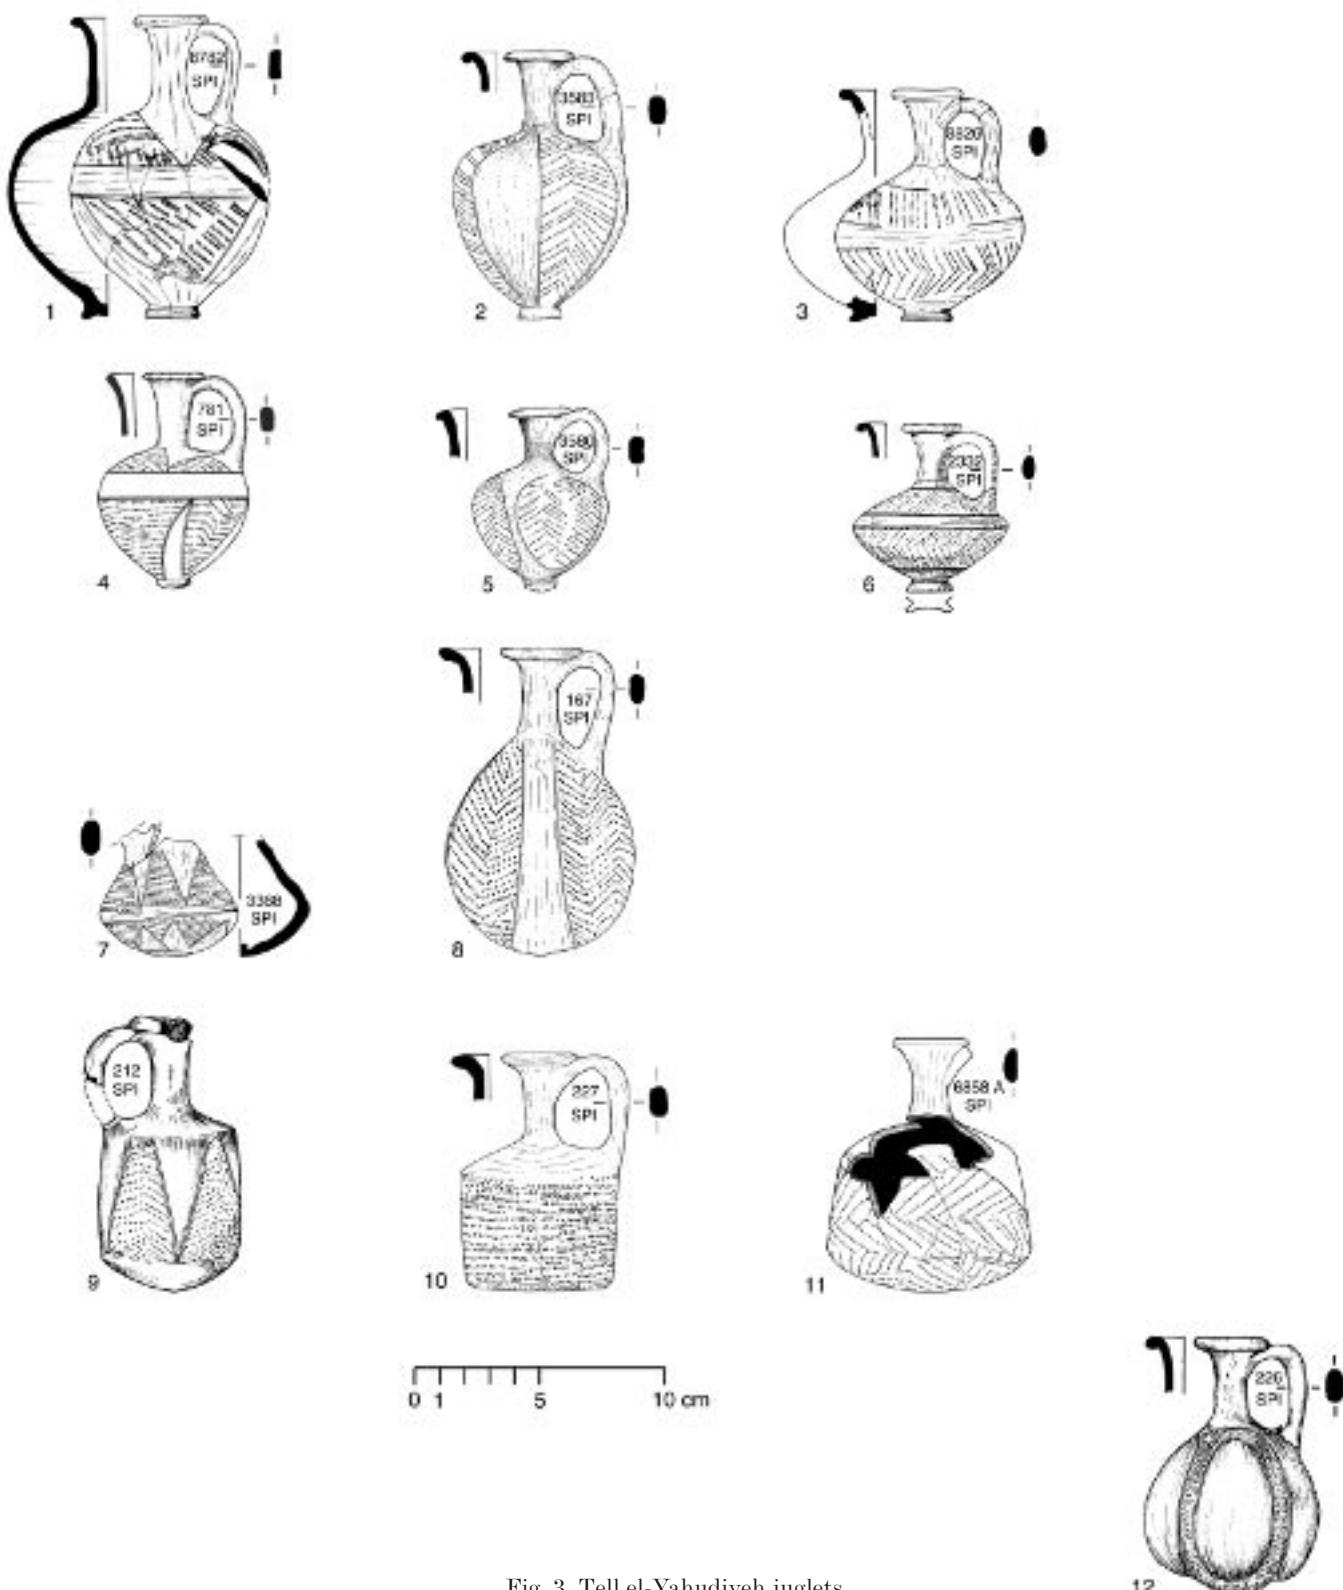

Fig. 3 Tell el-Yahudiyeh juglets

versions (Fig. 3/5) were particularly popular in the earlier phase of the Hyksos time. Piriform 1c, globular (Fig. 3/7, 8), cylindrical (Fig. 3/9–11) and quadrilobal juglets (Fig. 3/12) appear frequently.

From str. E/1 onwards, black burnished juglets with incised, but not incrusted, patterns can be found only in the settlement. In these cases, the burnishing covers the entire vessel. One type shows horizontal

D/2					

Fig. 5 Chronological appearance of Tell el-Yahudiyeh juglets from settlement layers and ichthyomorphic juglets

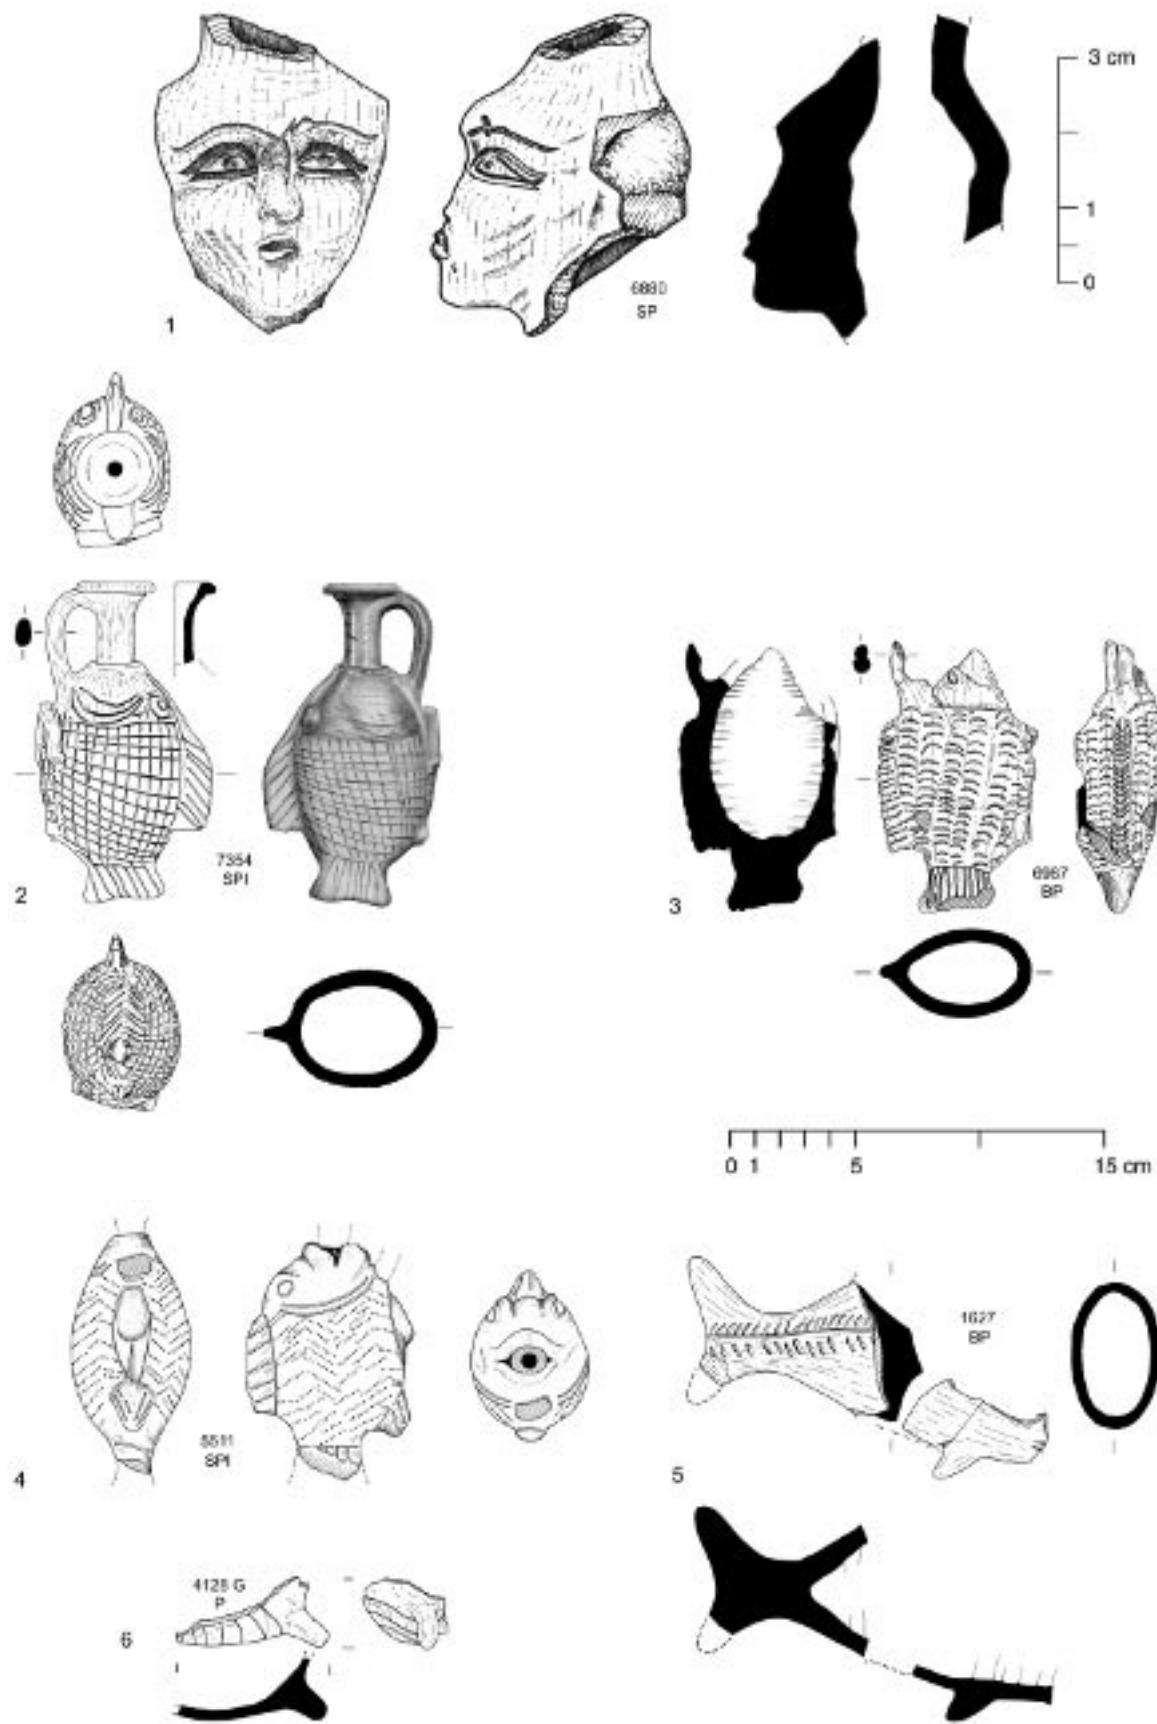

Fig. 6 Tell el-Yahudiyeh vessels

combed grooves¹¹ (Fig. 4/3). This shape and pattern is found on large and middle size juglets and exists into str. D/2.¹² Towards the end of the Hyksos time, from str. D/2 onwards, in the settlement layers, middle sized juglets with a similar horizontal combing pattern occurs, whose surface shows no traces of burnishing anymore (Fig. 4/2).

In the excavation of Tell el-Dab'a, until now, small and medium sized black burnished juglets with horizontally or vertically incised wavy combing patterns have been found only in the settlement layers of str. E/1 (Fig. 4/4, 5). In one case, the juglet was decorated with alternating horizontal plain and incised bands and is black burnished all over (Fig. 4/6).

Fragments of large, round-bottomed jugs with standing and hanging incised triangles filled with a herring bone pattern above and below a horizontal burnished band appear from str. E/1 until the end of the Hyksos period in the settlement (Fig. 4/1). A similar piece comes from the settlement layers of W.M.F. Petrie excavations at Tell el-Ajjul¹³ and Phase 11 at the recent excavations in Ashkelon.¹⁴

The other vessel types of Tell el-Yahudiyeh style are very rare. From the end of the 13th dynasty and the very beginning of the Hyksos period comes a small brown burnished pot with a leaf and fir branch decoration (Fig. 4/7). These motifs are known from Cypriote juglets¹⁵ and the backs of scarabs of this period.¹⁶ It is also made of I-d clay and is one of the last brown burnished vessels on the site.

A unique piece is the red burnished base of an either cylindrical juglet or a kind of a pot (Fig. 4/8), dating to str. D/3. It is incised with horizontal linear and wavy grooves and its fabric, I-d clay, puts it into the MB-sphere.

ANTHROPOMORPHIC AND ZOOMORPHIC TELL EL-YAHUDIYEH VESSELS

Part of the neck of a black burnished anthropomorphic juglet in the shape of an African's head (Fig. 6/1) comes from a room filled with mud brick debris, presumed by the excavators to be a tomb of a late Hy-

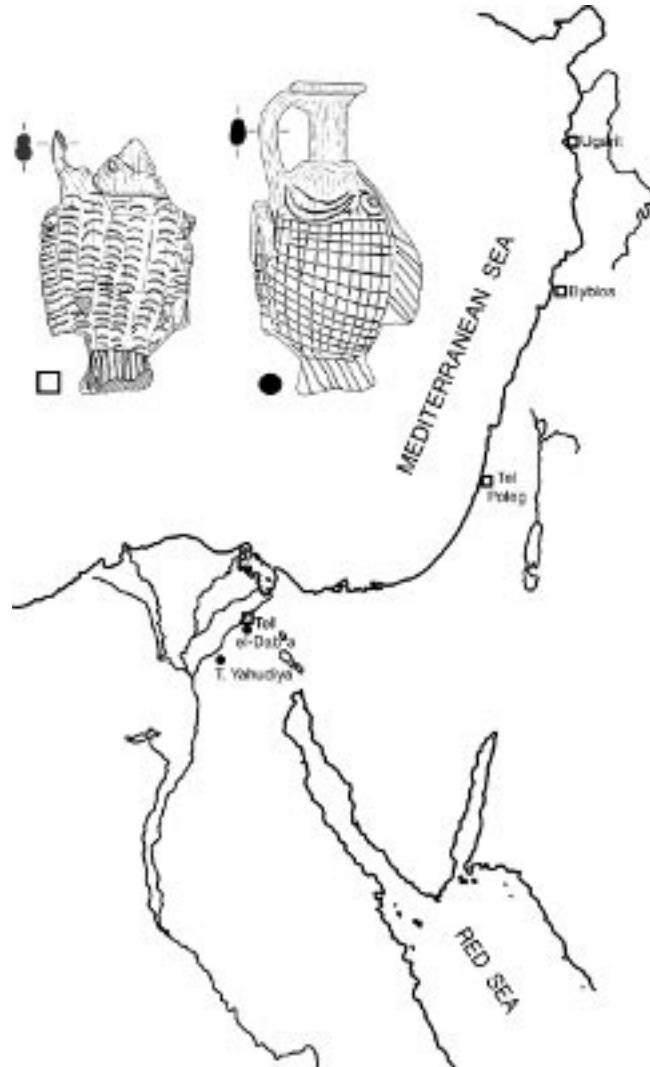

Fig. 7 Distribution of fish-shaped Tell el-Yahudiyeh juglets

sos period context,¹⁷ str. D/2. The fabric and surface treatment place this vessel into the Hyksos period layers. Juglets with their necks shaped in the form of humans or animals are known already from earlier periods of the Levantine coast, like the red burnished juglet from Nahariya¹⁸ of the transitional MBIIA/B period in the shape of a crouching monkey, as well as one from Byblos.¹⁹ An anthropomorphic juglet, which is today in the Museum of Amman, comes

¹¹ A fragment of this type see also in: M. BIETAK, *Tell el-Dab'a V*, 192, Abb. 146/2.

from Jericho and dates most probably into the MBIIA period.²⁰

A nice looking group of Tell el-Yahudiyeh vessels are the ichthyomorphic juglets. In Tell el-Dab'a they appear from the end of the 13th dynasty/the beginning of the Hyksos time onwards. All are made of Nile clay. The earlier examples are brown burnished all over the body with incised scales and fins and are equipped with a double handle (Fig. 6/3, 5). These date to the end of the 13th dynasty/the very beginning of the Hyksos period and stand in a continuous line of development with the fish-shaped jug from an MBIIA burial cave of Tell Poleg,²¹ with its burnishing and white incisions, and the numerous juglets of this type found mainly in Egypt, but also in Cyprus, in the Hyksos period.²²

Their double handles and brown burnishing over the incisions reflect the characteristics of the Tell el-Yahudiyeh juglets of the 13th dynasty as well as those of the monochrome burnished juglets of this period.

Monochrome burnished ichthyomorphic vessels with double handles, dating most probably to the first half of the MBIIB, can be found in the region of Byblos. From the "tombeaux de particuliers" (tomb 1 and 2) in Byblos,²³ comes a black burnished fish shaped juglet with its rim rolled to the outside and a double handle.²⁴ The other pottery from the tombs 1 and 2 is similar to pottery from Tell el-Dab'a strata F–E/3, which is equal to the transitional MBIIA/B and early MBIIB phases in Palestine. Piriform 1b juglets with three horizontal zones of decoration, a

rim curved to the inside, a double handle and a ring base, like the juglet no. 915 from the *tombeaux de particuliers*,²⁵ also appear in the tombs of str. F in Tell el-Dab'a.²⁶ The piriform type 1c with two horizontal decoration zones, an incurved rim, a double handle and a ring base, such as juglet no. 917 from these Byblos tombs,²⁷ has its parallels in the burials of Tell el-Dab'a in the strata F²⁸ and E/3,²⁹ most of these juglets being imported to the site. Furthermore, piriform juglets with stepped rims and double handles do not appear in Palestine³⁰ and Tell el-Dab'a³¹ before the end of the MBIIA and seem to be one of many markers for the beginning of the MBIIB period there. These attributes are found on another Tell el-Yahudiyeh juglet from the *tombeaux de particuliers* 1 and 2, no. 914,³² which shows vertical incised segments, again, a type of decoration which is not found before the early MBIIB period in Tell el-Dab'a. No. 918,³³ coming from the same tombs, shows a combination of incised Lotus flowers and spirals on a black burnished juglet of the Tell el-Yahudiyeh style. Vessels with a similar decoration have been found in the tombs of Tell el-Dab'a in str. E/3,³⁴ with some more crude versions in str. E/2.³⁵ The red burnished piriform juglet no. 919³⁶ from the *tombeaux de particuliers* with its rim rolled to the outside, a strap handle and a ring base, has again its oldest parallel at Tell el-Dab'a in a str. F burial. From the *tombeaux de particuliers* as well comes a deep pottery bowl, no. 911³⁷ with 2 attached ram heads. Wooden examples of this type are known from the oldest layer of a MBIIB multiple burial cave in Jericho,³⁸ and the settlement

²⁰ R.S. MERRILLEES, El-Lisht and Tell el-Yahudiya Ware in the Archaeological Museum of the American University of Beirut. *Levant* 10 (1978), pl. IX. This piriform juglet has a three strapped handle and a branch-like motif which is reminiscent of the tassel on the Syro/Cilician Ware of the MBIIA.

of Kahun,³⁹ which is known to have lasted into the 13th dynasty.

Approximately the same dates can be given to two fish vases from the AUB collection in Beirut. R.S. Merrillees has stated that these juglets are very similar to the Byblos jug and indeed do come from the same geographical region and time span.⁴⁰ The red burnished fish vase AUB 68.90⁴¹ with its everted rim and the double handle seem to be very close to the Byblos jug. While the other example, AUB 68.91, equipped with a strap handle and slightly smaller in size, might be a little bit younger and an forerunner to the earlier Tell el-Dab'a fish shaped juglets.

In Tell el-Dab'a, from str. E/1 onwards, the fish-shaped juglets are all black burnished on the unincised parts of the surface and have a strap handle (Fig. 6/2, 4). They strongly resemble the normal Tell el-Yahudiyeh juglets of the Hyksos period in their production features and attributes. The technique of applying lumps of clay as eyes on the head of the fish, which can be observed by the earlier juglets from Byblos,⁴² Beirut,⁴³ probably Ugarit⁴⁴ and Tell el-Dab'a,⁴⁵ dates the juglet TD 7354 earlier in the Hyksos period than the fish TD 5511, where the eyes are incised as a circular line with a tool. Also, the herring bone pattern for the scales seems to be typical of this period. Nearly all comparable vessels come from Egypt,⁴⁶ mainly from Tell el-Yahudiyeh.⁴⁷ They show

the same criteria as the examples from Tell el-Dab'a and should therefore be dated to the Hyksos period.⁴⁸ Fish juglets of a very similar shape, imported from Cyprus to Egypt, have been found at the very end of the Hyksos time in Tell el-Dab'a⁴⁹ str. D/2 and Tell Hebwa.⁵⁰

A burnished fragment from the beginning of the Hyksos period, probably comes from a bird shaped Tell el-Yahudiyeh juglet made of Nile clay⁵¹ (Fig. 6/6).

PAINTED JUGLETS

During a short time span, in the late 13th dynasty, painted "stepped rim" juglets were imported to Tell el-Dab'a (Fig. 8/1–3). They have an ovoid to piriform body, a stepped rim, a ring base and a strap handle, which has an additional small round handle added to the middle of the strap. All are decorated with different geometrical patterns, painted in red or reddish brown and then burnished all over. Two examples come from burials, while a larger one is from a settlement context. These juglets are inspired by the painted vessels of the MBIIA⁵² and have parallels in Kefar Szold from a disturbed cave burial dated by the excavator to the transitional MBIIA/B period,⁵³ two nearby multiple burial caves in Ginosar of the same period,⁵⁴ one multiple burial cave in Zefat,⁵⁵ from the multiple burial cave 1181 in Hazor, dated to the transi-

⁵⁵ E. DAMATI and Y. STEPANSKY, A Middle Bronze Age II Burial Cave on Mt. Canaan, Zefat (Wadi Hamra), *Atiqot* 29 (1996), 9*, fig. 9/1. The tomb is dated by the excavators from the early MBIIA to the late MBIIB.

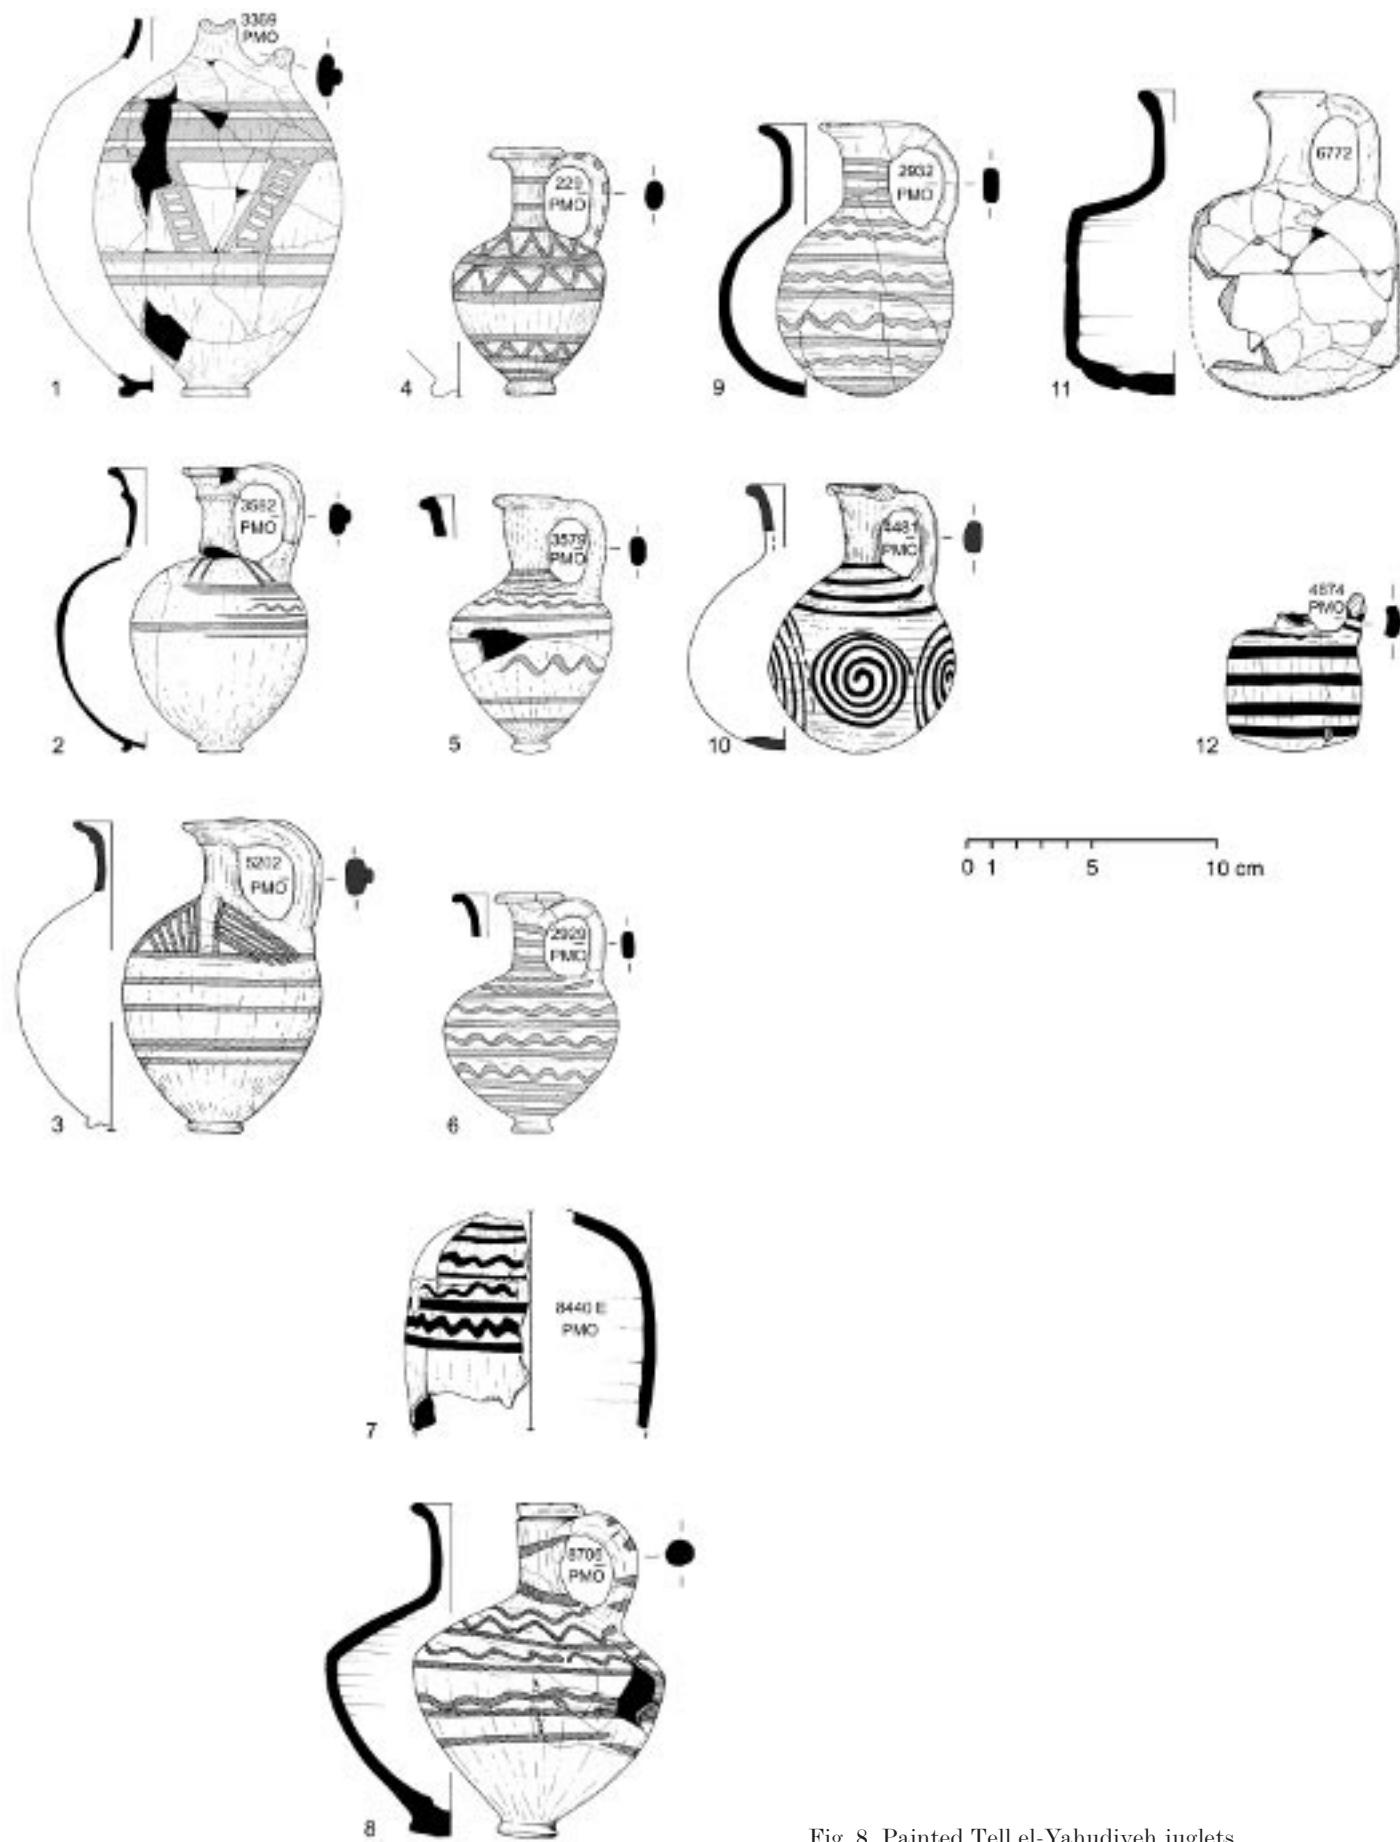

Fig. 8 Painted Tell el-Yahudiyeh juglets

tional MBIIA/B and early MBIIIB phase,⁵⁶ from a salvage excavation at Tel Na'ama in the Hula Valley,⁵⁷ in Tel Dan strata XI and X, both put into the MBIIIB by the excavators,⁵⁸ in a burial of the middle MBIIIB from Kamid el-Loz⁵⁹ and another single burial from niveau X of the earlier MBIIIB in Tell el-Ghassil.⁶⁰ One example of this juglet type comes from the Lebanese coast, from tomb 66 at Ruweise,⁶¹ again dating into the transitional MBIIA/B and early MBIIIB. Most of these parallels cluster geographically between the Sea of Galilee and the Beqaa, slightly earlier and within the same time range as the Tell el-Dab'a pieces, they could hint to one possible source of imports⁶² to Egypt at the end of the 13th dynasty and the beginning of the Hyksos period.

A second group of painted juglets are the so called *Painted Tell el-Yahudiyyeh Juglets*.⁶³ With their piriform, biconical, globular or cylindrical bodies, their rims rolled to the outside, strap handles and small ring or button bases, they show the same features as the incised Tell el-Yahudiyyeh juglets of the Hyksos time. The early examples (Fig. 8/4)⁶⁴ were imported to the site. With the beginning of the Hyksos time most juglets of this type are produced of I-d Nile clay (Fig. 8/5, 6, 7, 9) with a concentration of their appearance in the first half of this period. The decoration shows mainly horizontal zigzag or wavy lines

between stripes, often with ticks on the rim and the handle. In most cases, the painting occurs in red and rarely in black. Some of the juglets produced in Egypt do have a white wash beneath the painted décor. Others, and all the imported pieces, have their decoration painted on the natural surface. All juglets are burnished after decoration. At the end of the Hyksos time, in str. D/2, examples made of I-b-2 clay appear (Fig. 8/11). In the same level a new fabric, whose origin is still unknown, was used for the production of these juglets (Fig. 8/8, 12).⁶⁵

T. Bagh suggests possible inspiration for the decoration of these juglets through Cypriote imports to Egypt.⁶⁶ Another possible forerunner for this type might be the bichrome painted juglet from stratum XII in Tel Dan of the later MBIIA period.⁶⁷

Globular juglets with a painted spiral decoration (Fig. 8/10) on their body are not very common in Tell el-Dab'a. So far only two pieces of this type have been found at the site. One comes from a jar burial, which cuts into the floor of a villa and was placed alongside a wall of this building in area F/I. It was imported to the site from the Syro-Palestinian region.⁶⁸ With its decoration of 4 black painted spirals on the body and its rim-ticks, it resembles a piece coming from a burial at Tell el-Ajjul, which dates probably into the second half of the MBIIIB.⁶⁹ The

⁵⁶ A.M. MAEIR, Tomb 1181: A Multiple-Interment Burial Cave of the Transitional Middle Bronze Age II A-B, in: A. BEN-TOR and R. BONFIL (ed.), *Hazor V*. Jerusalem 1997, 30, figs. IV.5/12, 13. This cave contained 11 individuals and might have lasted a little bit longer than suggested by Maeir into the MBIIIB. See for that figs. IV.2/2, 6, 10, 11, which see to be the latest types in this cave.

⁵⁷ R. GREENBERG, L.K. HORWITZ, O. LERNAU, H.K. MENIS, H. KHALAILY and O. MARDER, A Sounding at Tel Na'ama in the Hula Valley, *Atiqot* 35 (1998), 11, fig. 17/4. This juglet comes from phase 2, which was ascribed by the excavators to the uppermost MBII level and a possible given date of late MBIIA/early MBIIIB.

Fig. 9 Chronological appearance of painted juglets

other piece from Tell el-Dab'a is locally produced and was squeezed into a cleft of a wall from a str. D/2 building excavated in the area A/V.⁷⁰ It shows only 2 black painted spirals as a décor, instead of 4. Spirals as motifs on juglets can be found already in the MBIIA⁷¹ on vessels of the LPW, as well as on the

aforementioned painted juglets with stepped rims and on painted juglets of the MBIIIB.⁷²

A small imported vase (Fig. 10) from a settlement layer of the earlier Hyksos period shows the same kind of surface treatment and red painted horizontal wavy line decoration as the painted imported Tell el-Yahudiyeh juglets. Additionally, it shows a cavity at the greatest diameter, possibly indicating some unknown protruding extension of the vessel. It is also possible, however, that at this point a spout or a handle was broken off. A close parallel from tomb J 19 in Jericho⁷³ of the middle MBIIIB shows a pedestal vase without any spout or handle.

MONOCHROME JUGLETS

In Tell el-Dab'a, the monochrome burnished juglets, which appear already in the layers of the MBIIA as imports, were copied in Egyptian I-d clay from the middle of the 13th dynasty onwards. They undergo a

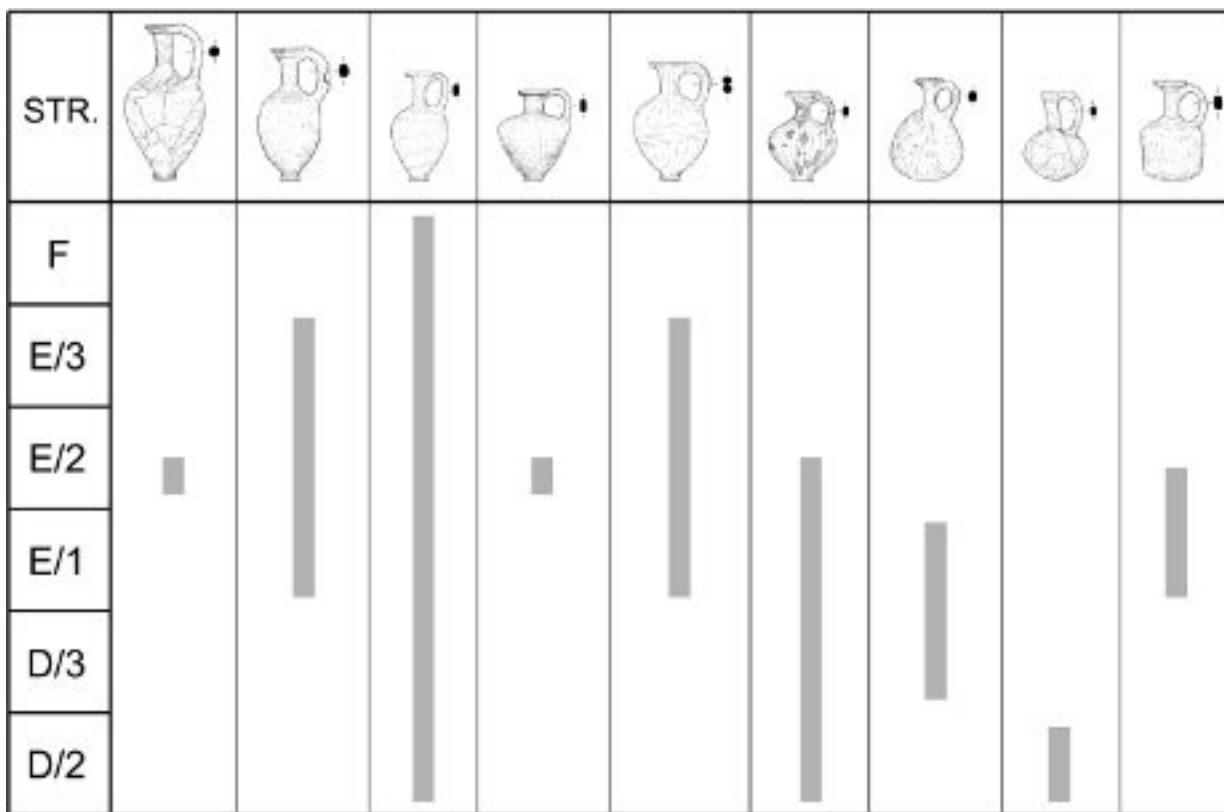

Fig. 11 Chronological appearance of monochrome burnished juglets

gradual change during the second half of the 13th dynasty towards types of juglets which were restricted in the 15th dynasty to the north-eastern Nile Delta. Originally brown, red, black, sometimes yellow or only surface burnished, they appear in the Hyksos phases only in black and red burnishing. While in the earlier periods nearly all of them were made of I-d clay, towards the end of the Hyksos era I-b-2 clay was also used for the production of these juglets.

Here and there, imported monochrome burnished juglets appear in the first half, but are nearly absent in the second half of the Hyksos period. Some examples of these are still equipped with a double handle (Fig. 12/6), others are often bigger in size than the local ones (Fig. 12/3). Juglets with a stepped rim (Fig. 12/1), which were dominant in the earlier MBIIB levels at the site, have their last remnants in str. E/1, where they can be found in the settlement and in

tombs. Most of them are locally produced and have an ovoid to ellipsoid body, a single handle with a round section and a ring base. They are usually black burnished (Fig. 12/2) though some rare cases show red burnishing.

All the other types, either piriform, biconical, globular or occasionally cylindrical in shape, have a rim rolled to the outside, a strap handle and a small ring or button base. In general they are smaller in size than their forerunners in earlier levels.

Exact parallels come from the excavations at Tell el-Yahudiyyeh⁷⁴ and Tell el-Maskhuta.⁷⁵

DIPPER JUGLETS

In Tell el-Dab'a dipper juglets exist from the late 12th dynasty into New Kingdom levels.⁷⁶ The earlier examples were imported to the site. From str. F onwards, when the potters from Avaris started to

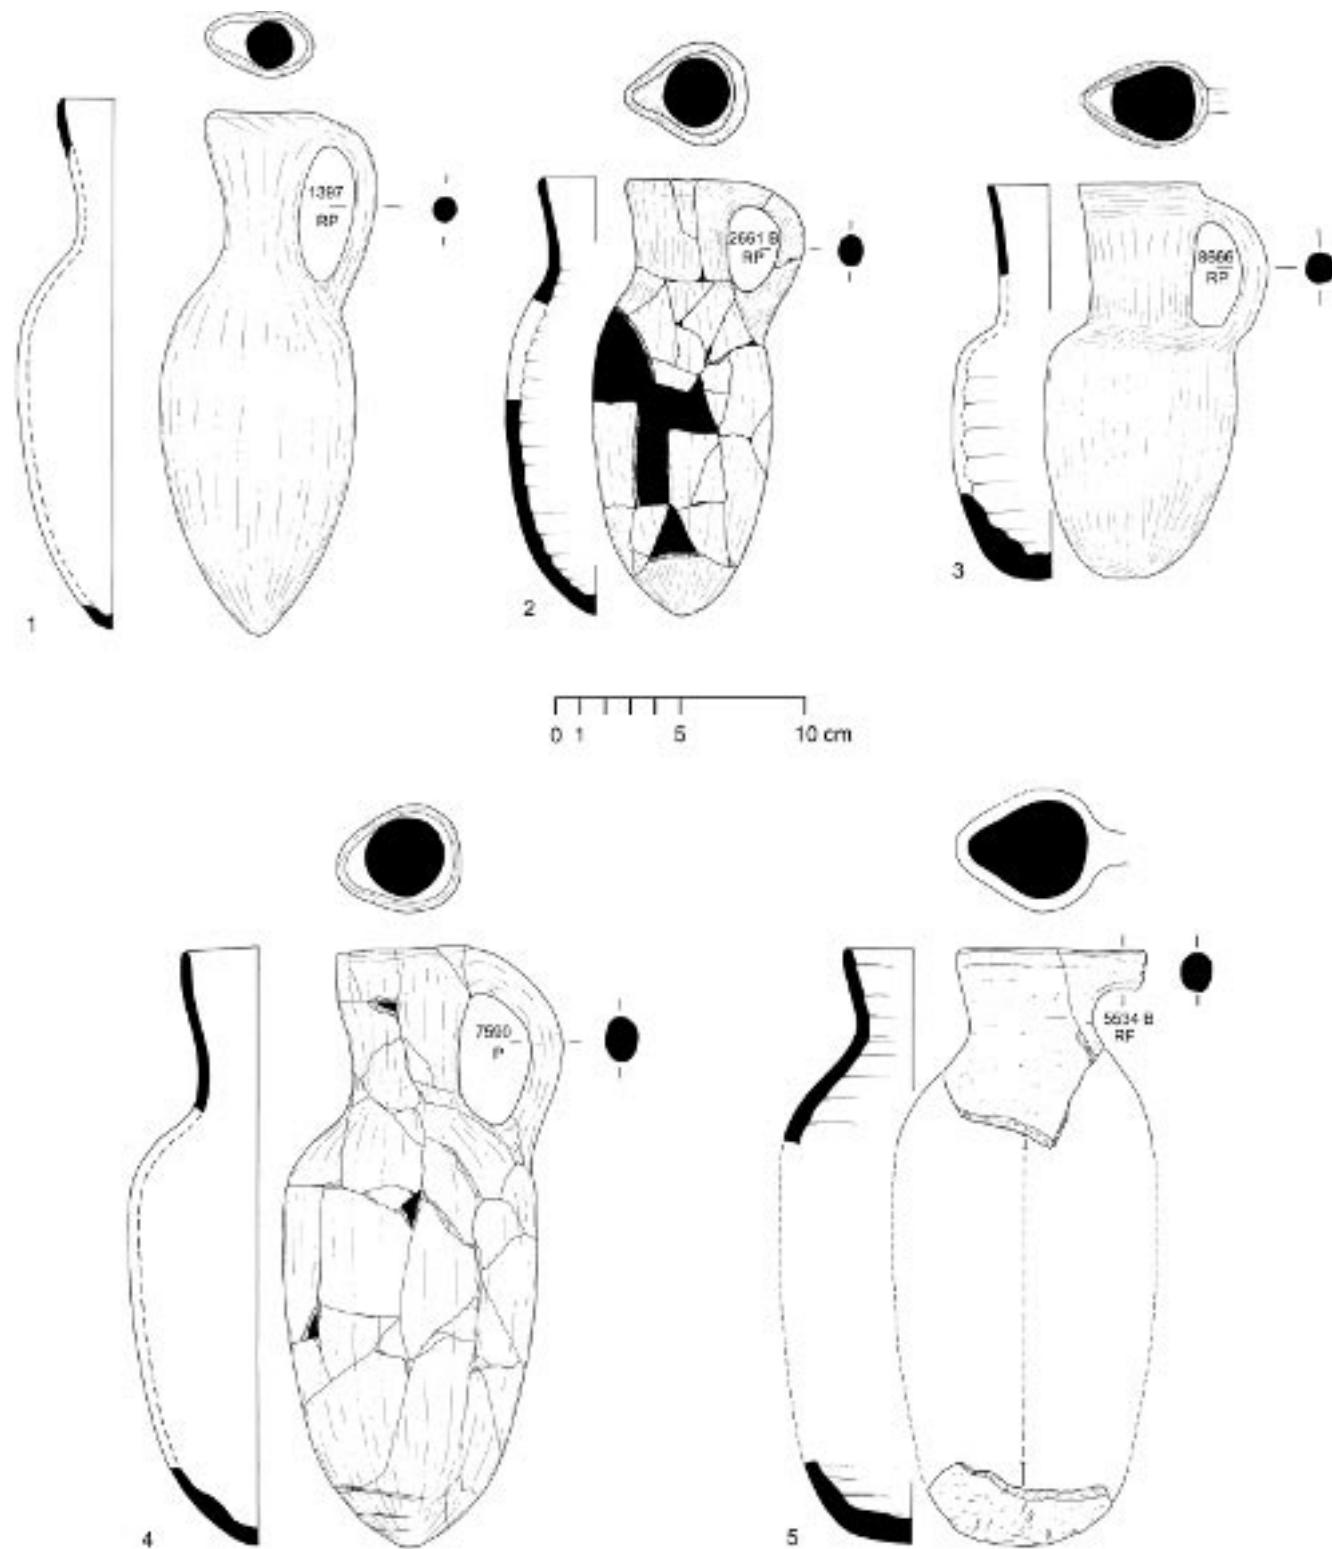

Fig. 14 Dipper juglets

manufacture this vessel type in I-d clay, they show their own local development.⁷⁷

In the very beginning of the Hyksos era a small amount of red burnished dipper juglets were import-

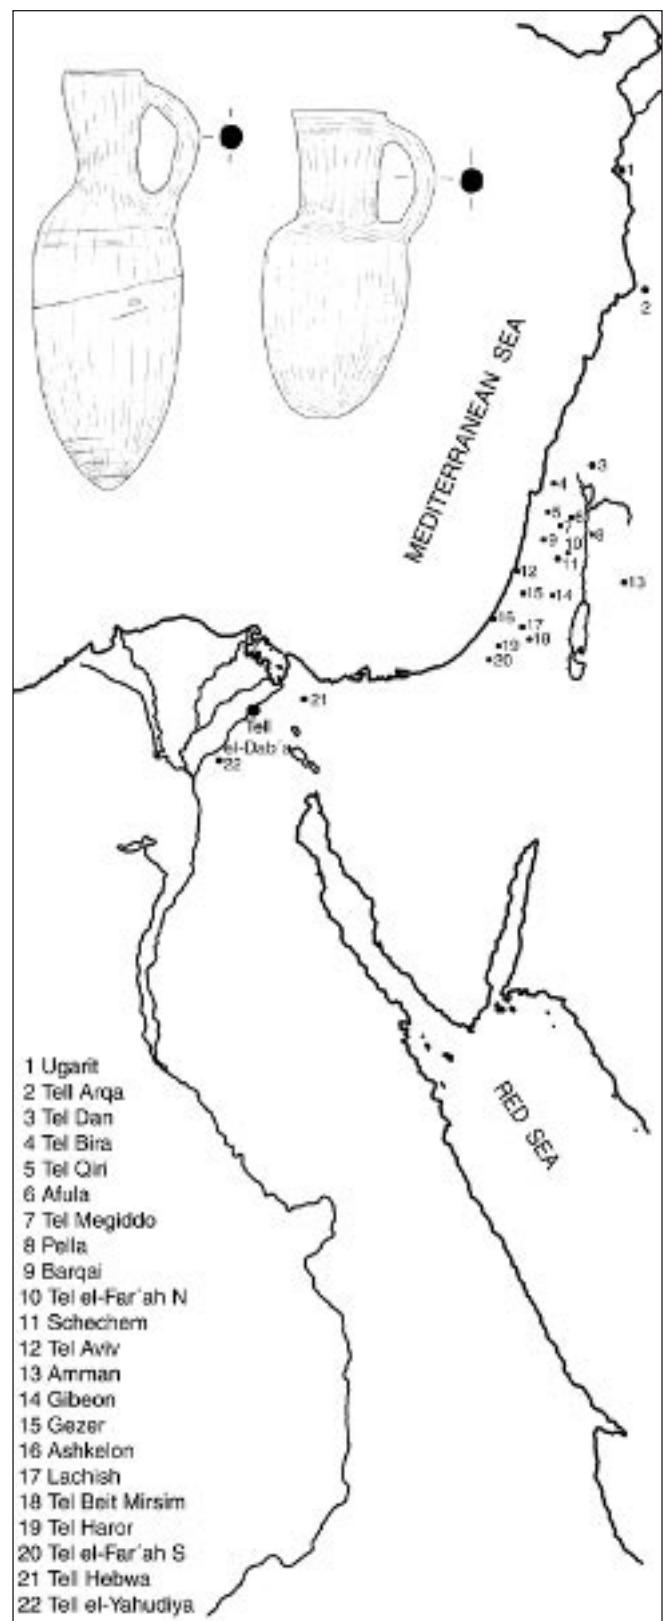

Fig. 15 Distribution of dipper juglets

ed to the site. From str. E/1 onwards, all of the normal sized dipper juglets (maximum height between 15–20cm) were produced in I-d clay. While they are slim and tall in str. E/1 (Fig. 14/1), they do develop to a more ellipsoid body shape in str. D/3 (Fig. 14/2). Both types have a V-shaped base, which have been trimmed with a tool. In str. D/3, the production of these dipper juglets starts also in I-b-2 clay, which becomes the dominate fabric for these vessels from the late 15th dynasty onwards. In str. D/2, they get a pronounced shoulder and their bases are cut from the rotating wheel (Fig. 14/3). Oversized, tall dipper juglets (24cm) are very rare. Only one example from the Syro-Palestinian region has been found in a burial of str. E/1 (Fig. 14/4). Its surface was burnished. All the other examples of this tall type were made in Egypt. They were red washed and have been found only in cultic contexts of the Hyksos levels (Fig. 14/5).

Dipper juglets from the later MBIIIB and early MBIIIC have been found all over Palestine as well as in some towns at the Levantine coast.

PLATTERS AND SHALLOW BOWLS

One type of bowl, which existed in the Syro-Palestinian region during the MBII period and has been found in Tell el-Dab'a from the MBIIA levels onwards, is a *bowl with an inverted rim* (Fig. 17/3). Originally imported, they were soon copied in local clays. In the Hyksos period the bowls were made of I-b-2 fabric. While at the beginning of the 15th dynasty these bowls were the dominant type of open bowls at the site, their amount declines in favour of an Egyptian type of bowls with straight rims in str. D/3 and are absent from str. D/2 onwards. Most of them are red washed in- and outside, with some the red colour appears only at the rim and the inside of the bowl or the vessel remained plain. Occasionally there are examples with a red burnishing.

With the transitional MBIIA/B period, str. F in Tell el-Dab'a, appears a *bowl with an inverted rim and a red burnished or painted cross* at the interior and a red burnished or painted rim (Fig. 17/2). They are found in the settlement as well as the tombs until the middle of the Hyksos time, str. D/3. Parallels show

⁷⁷ For the development see: K. KOPETZKY, The Dipper Juglets of Tell el-Dab'a. A Typological and Chronological Approach, in: M. BIETAK (ed.), *The Middle Bronze Age in the Levant*, 227–244. Note that fig. 8 there needs to be replaced by the above shown fig. 13.

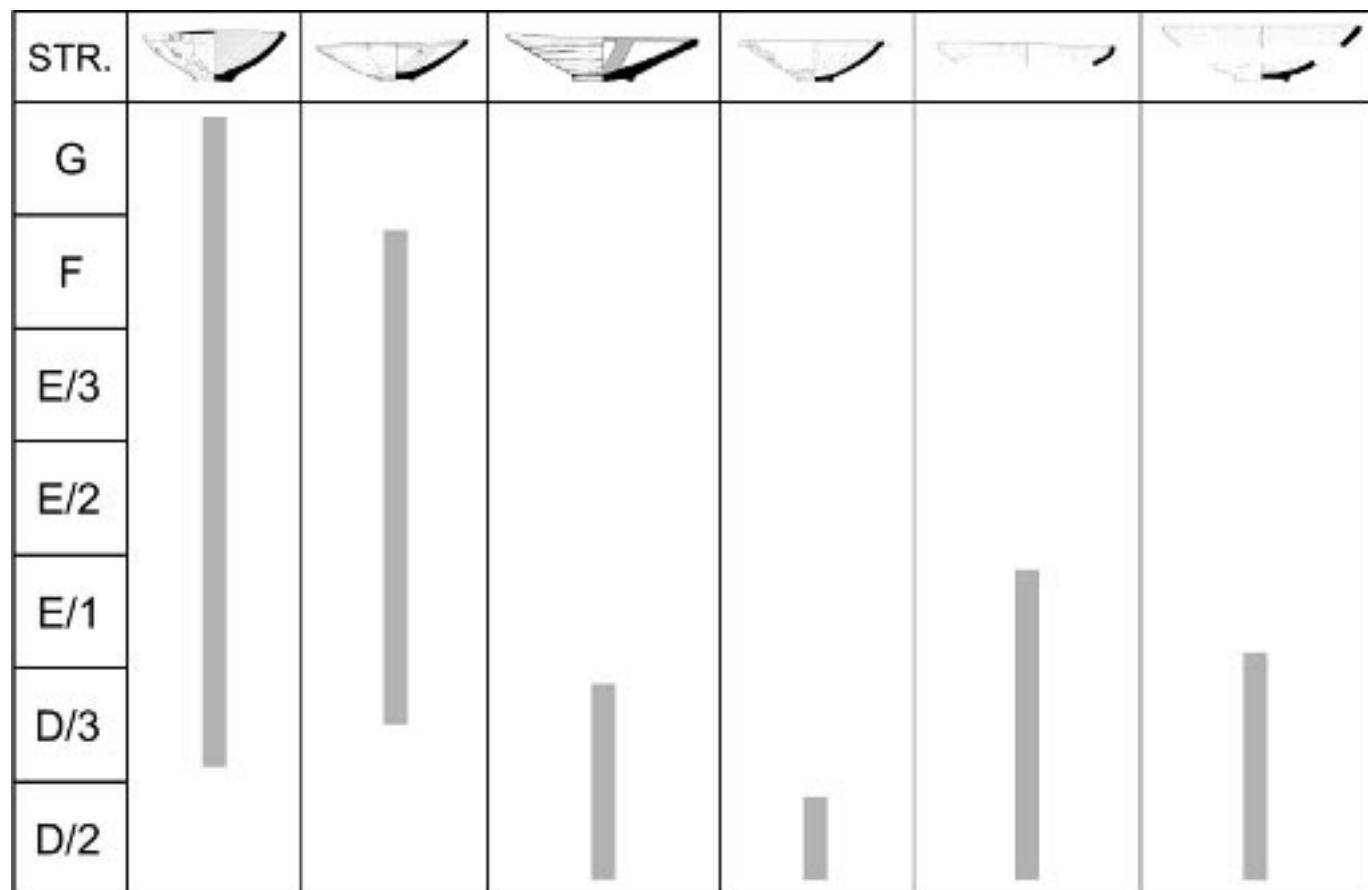

Fig. 16 Chronological appearance of platters and shallow bowls

up mainly in the Sharon plain⁷⁸ and sporadically in inland Palestine.⁷⁹

This type is replaced by a *bowl with a straight ending rim* (Fig. 17/1) showing the same kind of décor and surface treatment as the aforementioned. They appear for the first time at the very end of str. E/1/the beginning of str. D/3 and are markers for the middle to the late Hyksos pottery.

In Lachish,⁸⁰ in level P-4 dated to the MBIIB period and in tomb R8.8079 from Tell el-Maskhuta,⁸¹ of the middle to late Hyksos period, comparable pieces have been unearthed.

Large red burnished open bowls with a straight rim and a ring base (Fig. 17/6) appear in this period. They have a rim diameter of about 30cm and are either completely radially burnished or a radial burnishing inside and a horizontal burnishing at the rim and the outside of the vessel. However, up to now, none of the examples from the Hyksos period shows a concentric stripe burnishing inside the bowl. They are manufactured, either of I-d or I-b-2 clay. A possible parallel in shape, but with a different type of burnishing, can be found in Megiddo tomb T 3095⁸² and Barqai in the third burial phase of a rock cut tomb.⁸³

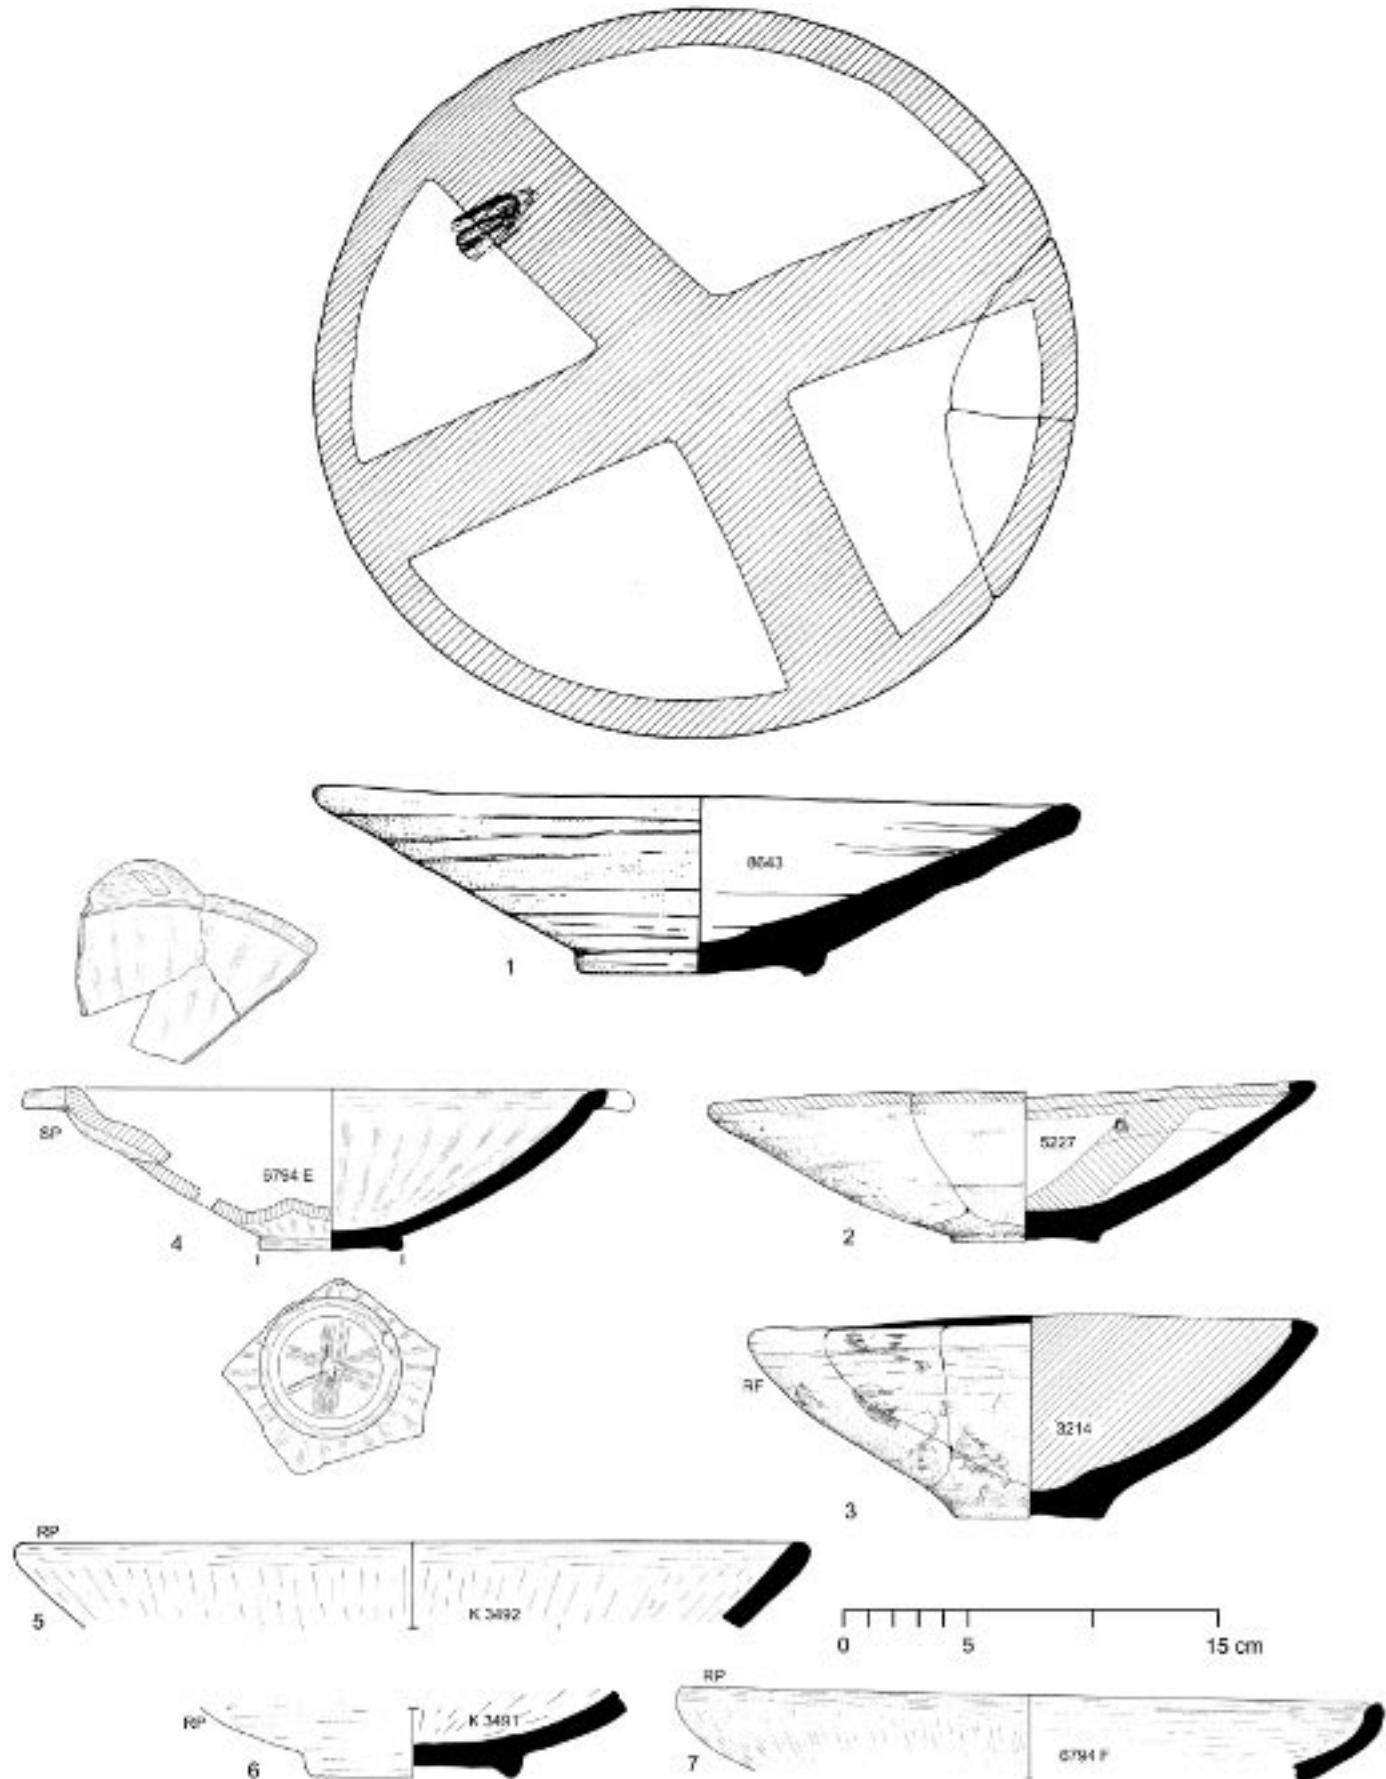

Fig. 17 Platters and shallow bowls

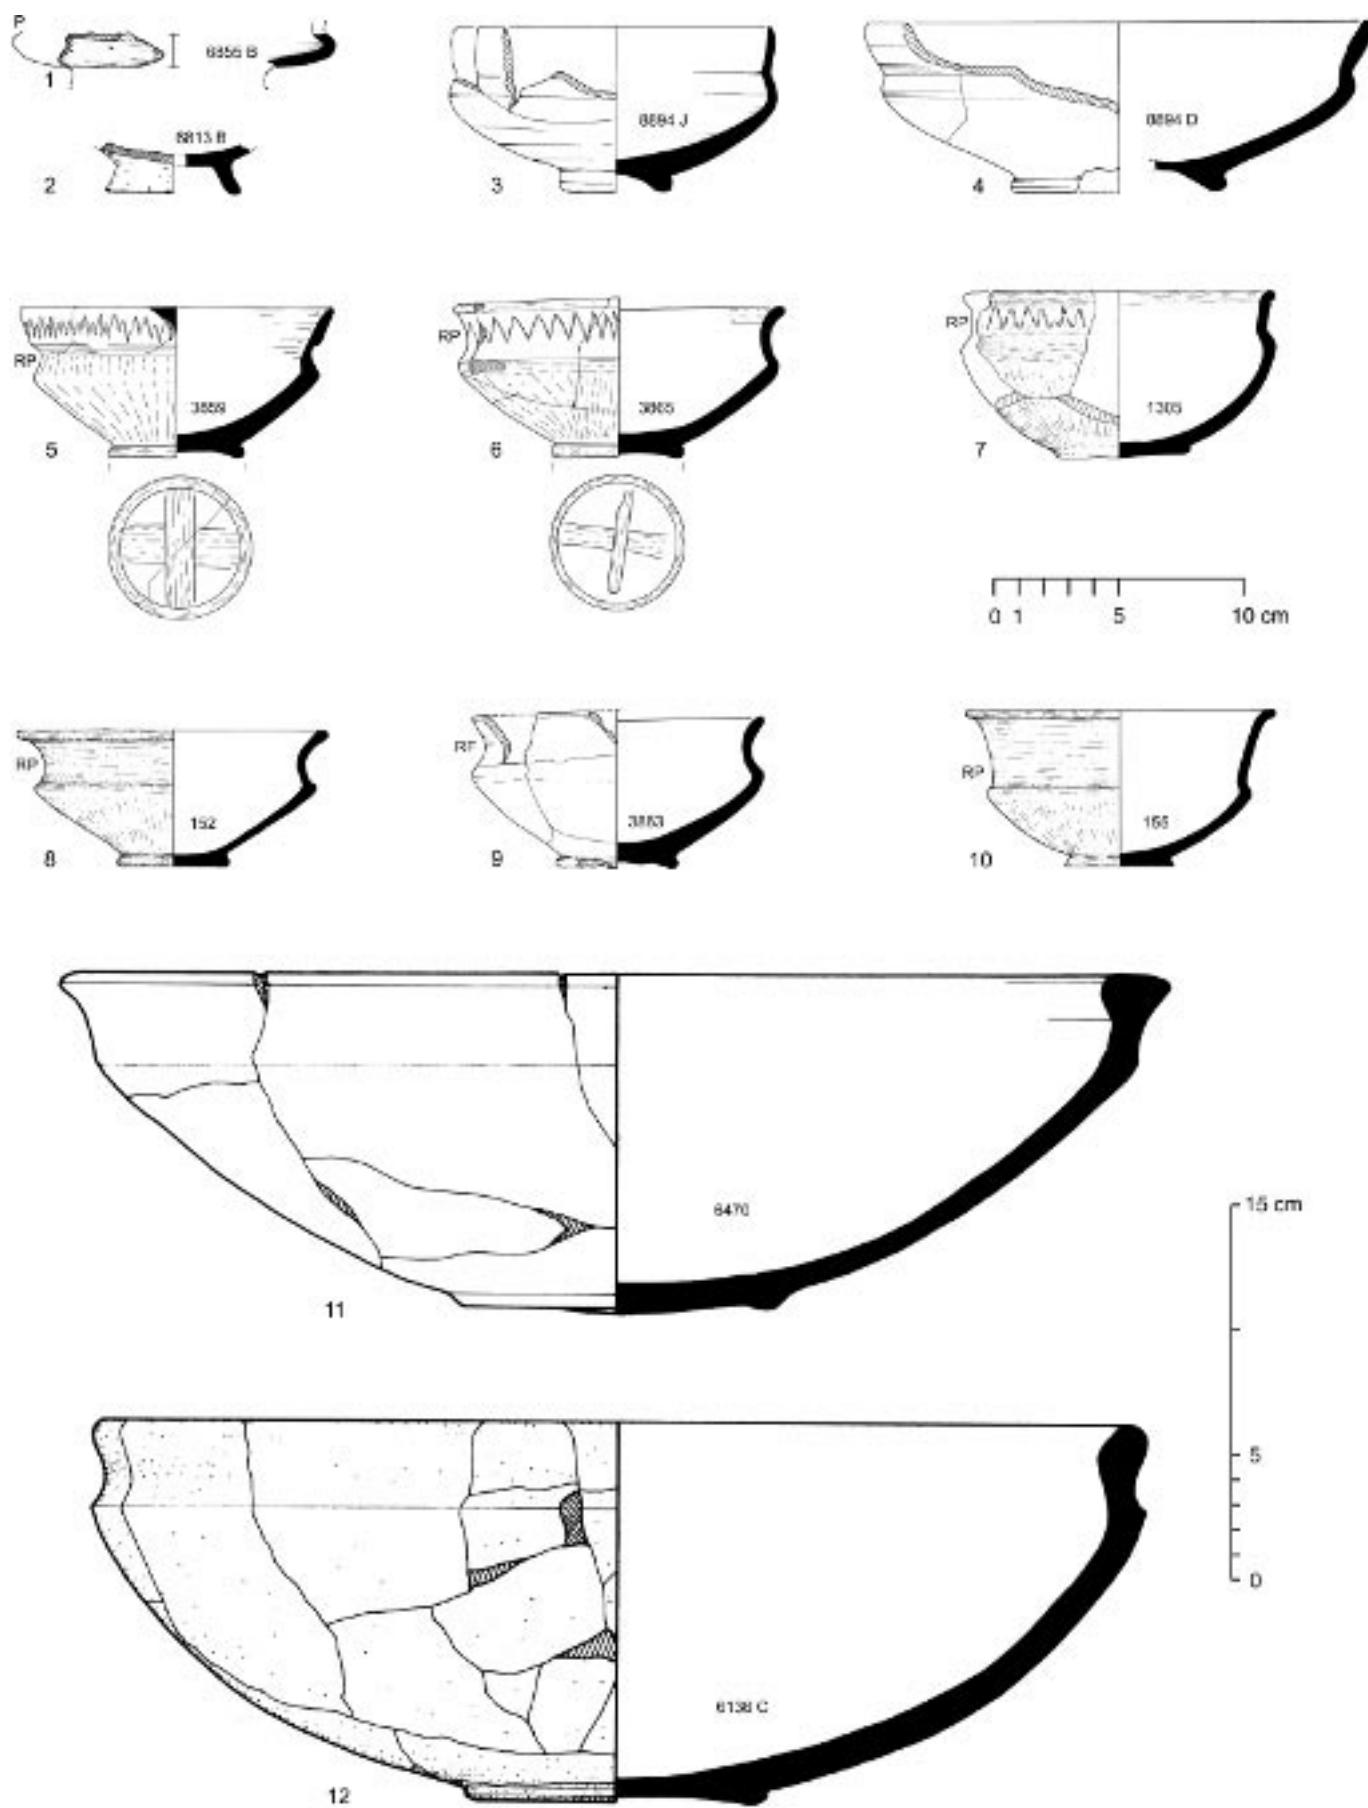

Fig. 18 Bowls with a carination

The same fabrics were used to produce *bowls with a slightly incurved rim* (Fig. 17/7), which were mostly brown burnished with occasional appearances of red or black burnishing. They are equipped with a ring base. Rare imports of this type, which show a plain burnished surface, have been found in the settlement. A comparable piece⁸⁴ comes from phase II of the MBII gate at Ashkelon along with a possible parallel from the MBIIB levels at Shechem.⁸⁵

Every now and then, fragments of *bowls with spiral-shaped curlicues* from the second half of the 13th dynasty into the Hyksos period appear. They are made of I-d or I-b-2 fabric and have a black or red burnishing. The handles can be coil-shaped, like in tomb T.3087 in Megiddo;⁸⁶ in level P-4 at Lachish;⁸⁷ at the MBIIB-settlement layers at Shechem;⁸⁸ in a multiple burial cave at Gezer;⁸⁹ stratum D at Tell Beit Mirsim;⁹⁰ and at the nearby settlement of Tell el-Maskhuta in the Eastern Nile Delta;⁹¹ others are hook-shaped, like on the wooden bowls from the MBIIB tombs at Jericho.⁹² In some instances they are simple knobs or look like segments of a circle as on the represented piece (Fig. 17/4).

Some of them have a burnished cross design at the base of the bottom, which is a decorative pattern that appears also on burnished jars and carinated bowls in Tell el-Dab'a during the Hyksos period. This feature can be found on closed vessels, e.g. in Shechem in the levels XIX and XVIII⁹³ and in the tombs of Jericho.⁹⁴

BOWLS WITH A CARINATION

In the settlement layers of Tell el-Dab'a, a few fragments of imported carinated bowls (Fig. 18/1, 2) have

been found. They belong to the flaring type with a sharp carination and a higher ring base, which is typical for the MBIIB and MBIIC period in Palestine.

With the beginning of the Hyksos period, a new fabric, used mainly for MBII shapes, can be identified. It is a very sandy Marl clay, green to orange during the firing process, named II-f in the Tell el-Dab'a fabric system, and may have its origin in the Northern Sinai or the Gaza region. At the beginning of the era, it appears very rarely, becomes common from

D/3					
D/2					

Fig. 20 Chronological appearance of bowls

str. D/2 onwards and lasts into the New Kingdom levels. Fragments of carinated bowls (Fig. 18/3, 4)⁹⁵ made of this fabric come mainly from the settlement layers and have in most of the cases an uncoated and smooth surface. This type of vessel was also produced in I-b-2 clay, where they are often coated with a white wash. In these cases, the idea might have been to imitate the II-f vessels, which do have a whitish surface colour.

Now and then *shallow carinated bowls* with more or less *flaring rims* (Fig. 18/8-10) and a red wash or red burnishing are found in the Hyksos levels. They are manufactured of I-d and later I-b-2 fabric.

A characteristic group for the Hyksos period are red or, in rare cases, black burnished *shallow carinated bowls with a burnished zigzag-pattern* running around their neck and sometimes a burnished cross

at the bottom, made of I-d and I-b-2 clay. While the examples with a sharp carination (Fig. 18/5, 6) do come from large offering pits in connection with a temple area,⁹⁶ the more rounded ones (Fig. 18/7) exist in the tombs.

This type of zigzag pattern decorates also little globular pots (Fig. 21/3) which appear in the settlement layers from str. E/1 until D/2. Parallels for these pots, nearly all from MBIIIB contexts, are known from the settlement at Tell el-Maskhuta in the Eastern Nile Delta,⁹⁷ possibly a piece from Quibells excavation at El Kab in Upper Egypt,⁹⁸ the strata XIX and XVIII at Shechem;⁹⁹ the last layer of tomb A34 in Jericho;¹⁰⁰ from locus R1902 in Beth Shean¹⁰¹ in Palestine; and phase M in Tell Arqa in Lebanon.¹⁰² Typical for the Hyksos pottery are *large open bowls with a carination below the rim* (Fig. 18/11, 12). These

⁹⁵ The two nearly complete examples shown on the plate come from a pit and a surface layer of the New Kingdom levels in Ezbet Helmi, but they resemble the fragmentary types of the Hyksos period.

⁹⁶ V. MÜLLER, Offering Practices in the Temple Courts of Tell el-Dab'a and the Levant, in: M. BIETAK (ed.), *The Middle Bronze Age in the Levant*, 295, figs. 13/2, 3.

rims can be flaring or folded to the inside and horizontally trimmed with a tool. These vessels are made of II-f clay. Similar bowls come from Tell el-Maskhuta¹⁰³ and Tell Hebwa.¹⁰⁴

GLOBULAR BOWLS AND STORAGE JARS

Small burnished bowls have been found in settlement layers as well as in offering pits and tomb contexts. Amongst them only a small amount were classified as imports (Fig. 21/1). The bulk of them were made of Egyptian I-b-2 and sometimes I-d clay, and are either red or black burnished. Once in a while they show burnished patterns at their neck, such as the aforementioned zigzag decor or vertical stripes (Fig. 21/4). The ones in the Hyksos time are developed from the *globular bowls* of the MBIIA period and red or black burnished and have a high and more vertical neck, a higher carination and a ring base (Fig. 21/5, 9). D. ILAN observed the same phenomena for the globular bowls in the strata X and IX of the MBIIB and MBIIC period in Tel Dan,¹⁰⁵ where similar vessels have been found. In Tell el-Dab'a, fragments of these little bowls appear in the settlement layers already in the earlier Hyksos period, while the complete vessels come from tombs of the very end of this period. This group of vessels is widely spread. Fragments exist from the MBIIB levels in Ebla¹⁰⁶ and Ugarit¹⁰⁷ in Syria; over MBIIB contexts in Tel Dan to Tell el-Fâr'ah-North;¹⁰⁸ Megiddo¹⁰⁹ and Shechem;¹¹⁰ and the tombs of Jericho¹¹¹ in Palestine.

This type has been found also with a red wash over the upper part of the vessel (Fig. 21/10) and thus look

similar to a much bigger vessel of this period: *Globular storage jars* (Fig. 21/11), which appear from the beginning of the Hyksos period onwards and last into the New Kingdom levels. The upper part of these jars until the max. diameter is either horizontally red burnished or covered with a dark red wash. Their body stretches in the course of time from a more globular to a piriform one with a high carination.¹¹² While at the beginning their rim diameter lies around 20 cm, it enlarges up to 40 cm in str. D/2, where a great variety in sizes exists.¹¹³ All are made of I-b-2 clay. While most of the smaller examples come from burials, the large ones are a typical settlement shape. The inspiration for this vessel type might come from huge craters found in Tel Dan,¹¹⁴ Tell el-Fâr'ah-North,¹¹⁵ Jericho¹¹⁶ and the post-palace phase in Aphek.¹¹⁷ Only recently in the new excavations of Sidon an almost exact parallel for the elongated examples of this type has been found, reused as a late MBIIB child burial container.¹¹⁸

Since the end of the 13th dynasty / the beginning of the Hyksos period (str. E/2) small globular bowls exist, which have a vertical neck and in most of the cases a ring base (Fig. 21/6).¹¹⁹ The straight neck is horizontally combed. From time to time, this neck or the complete vessel was covered with a red wash. In the earlier levels they are manufactured of I-d and I-b-2 fabric, in the later Hyksos strata only of I-b-2. The inspiration for these bowls might come from the “collared” bowls which can be found from Ugarit,¹²⁰ Ebla phase Mardikh IIIA2,¹²¹ and niveau H1 in Hama in Syria;¹²² the MBIIB phase M at Tell

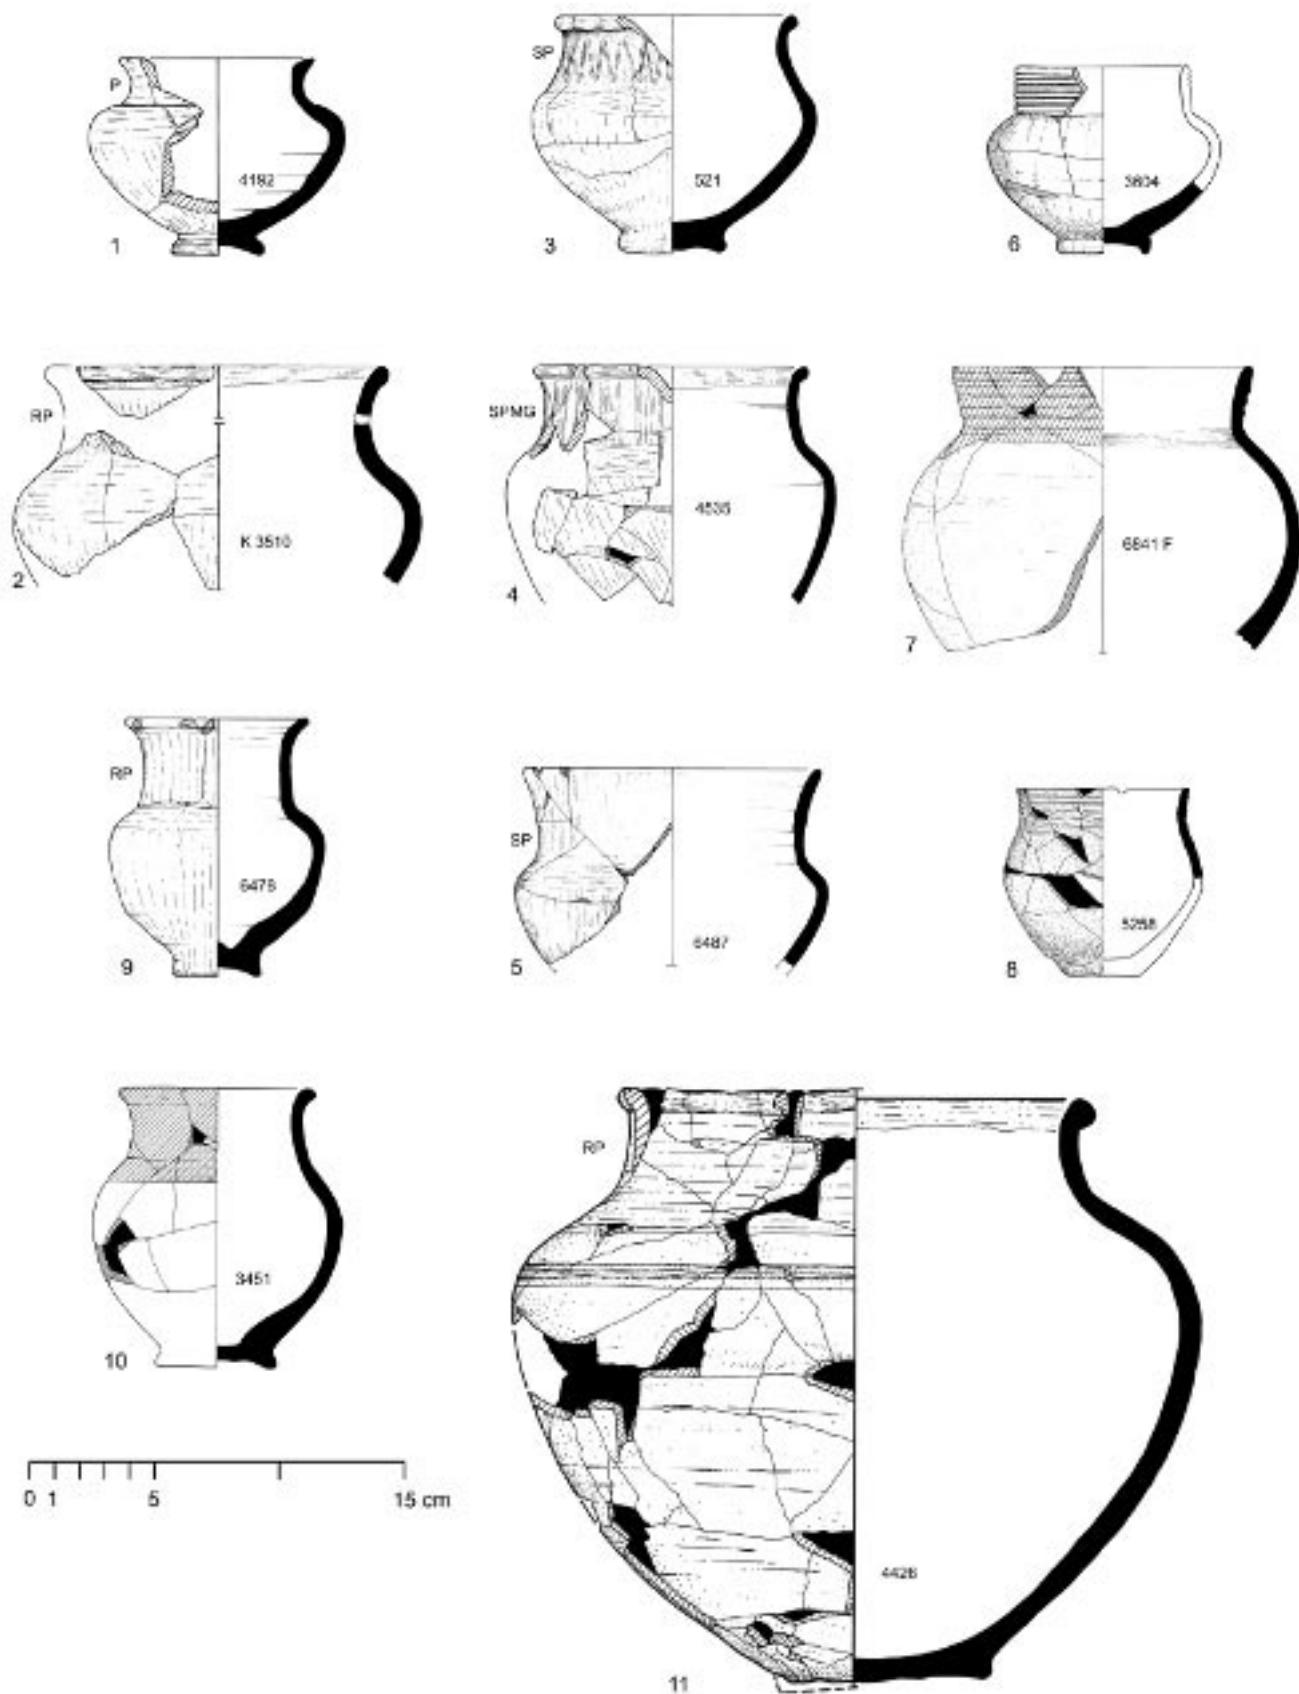

Fig. 21 Globular bowls and storage jar

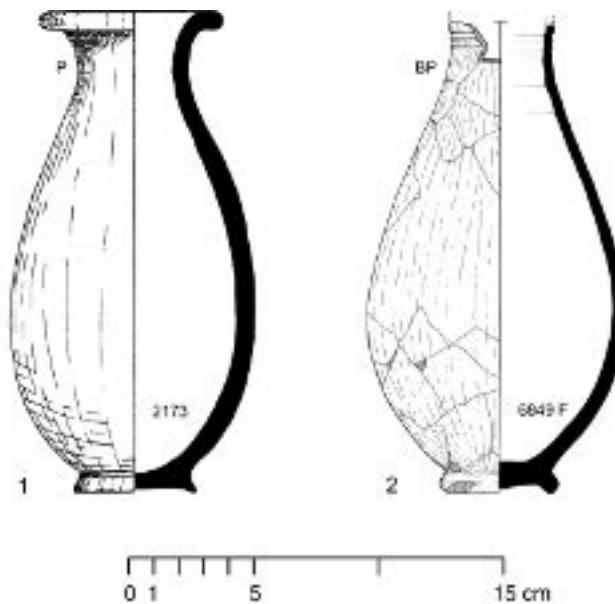

Fig. 22 Burnished jars

Arqa;¹²³ and the possible last burial in tomb T.1181 at Hazor.¹²⁴

A cruder example has a flat base and a biconical body shape (Fig. 21/8). A parallel has been found in Askut¹²⁵ in Nubia. Large sized pots of this type appear very rarely (Fig. 21/7).

JARS AND JUGS

Only two examples of slender jars with a ring base have been found in Tell el-Dab'a; both are from str. E/1. While one piece with an everted rim and a burnished surface (Fig. 22/1) is an import and comes from a burial, the other one with a dark brown burnishing and three horizontal grooves around the neck

(Fig. 22/2) is made of I-d clay and was found in a settlement context. This type of vessel is very rare at the site as well as in Palestine where only a few possible forerunners have been found in Aphek¹²⁶ and 'Ain es-Samiyeh.¹²⁷ A red burnished, imported jar from a burial in str. E/2¹²⁸ may fall chronologically between the earlier examples from Palestine and the Hyksos period pieces.

Two shoulder handle jugs (Fig. 23/1, 2) originate from an offering pit which cuts in from the surface, and has been dated preliminary into str. D/3.¹²⁹ Both have a high flat shoulder with one double handle, a broad ring base and are imported to the site. In one case the rim is kettle-shaped. While one piece shows no sign of surface treatment, the other one seemed to be vertically burnished. Until now this vessel type appears in Tell el-Dab'a in the Hyksos levels only in offering pits.¹³⁰ During the MBIIA period shoulder handle jugs with a triple or double handle exist mainly along the coast of Israel and Lebanon, but only a few are equipped with a kettle rim like the more globular jug from tomb 57 in Ruweise,¹³¹ or the one from tomb T.3141 at Megiddo.¹³² While the larger group of the MBIIB jugs can be found in inland Palestine, as before, most of them have a rim rolled to the outside and only rarely a kettle rim as in T.3026 in Megiddo¹³³ and tomb 616 in Tell el-Ajjul.¹³⁴

A very unusual piece is the handle fragment of a big red burnished jug in the shape of a duck or goose head (Fig. 23/3). It was attached to the rim of the vessel and is most probably an import.

One large piriform jug with a spout, a strap handle and a flat base comes from a burial, which dates probably to the very end of the Hyksos period¹³⁵ (Fig. 23/4). It shows no sign of burnishing or wash. Possi-

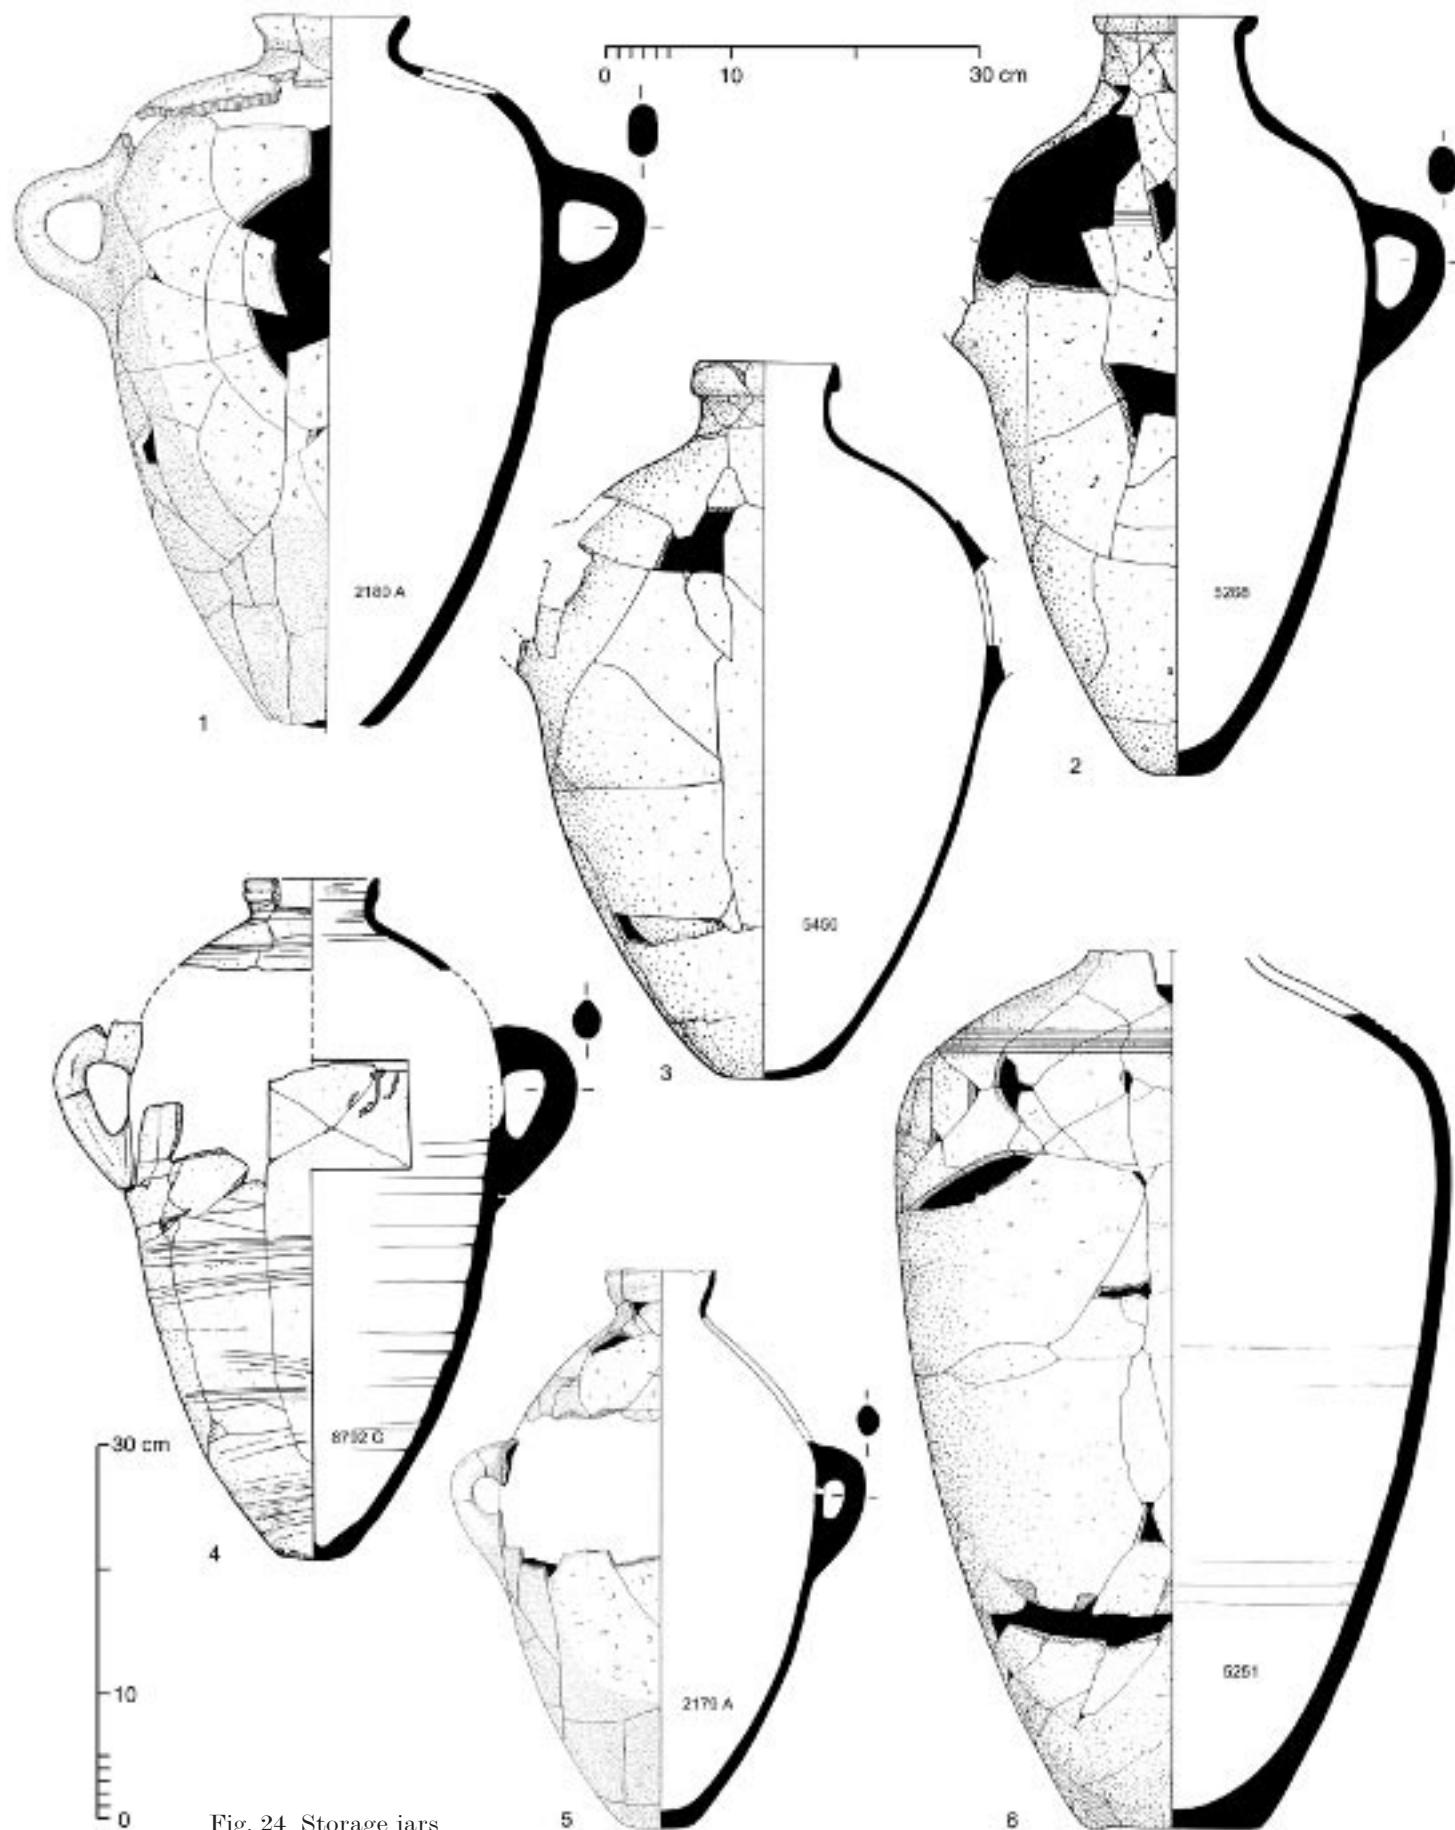

Fig. 24 Storage jars

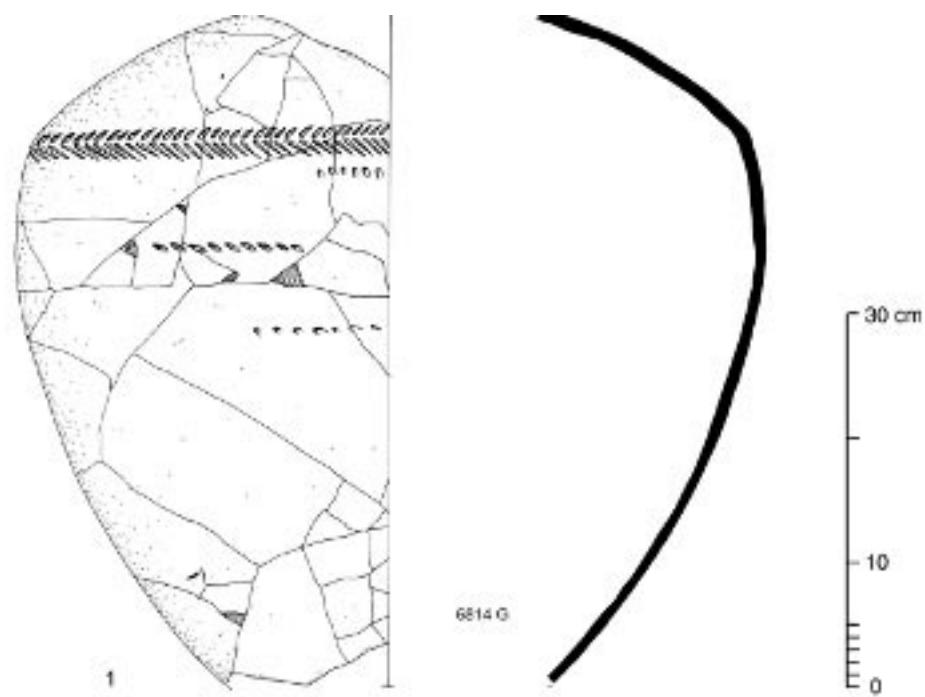

Fig. 25 Pithos

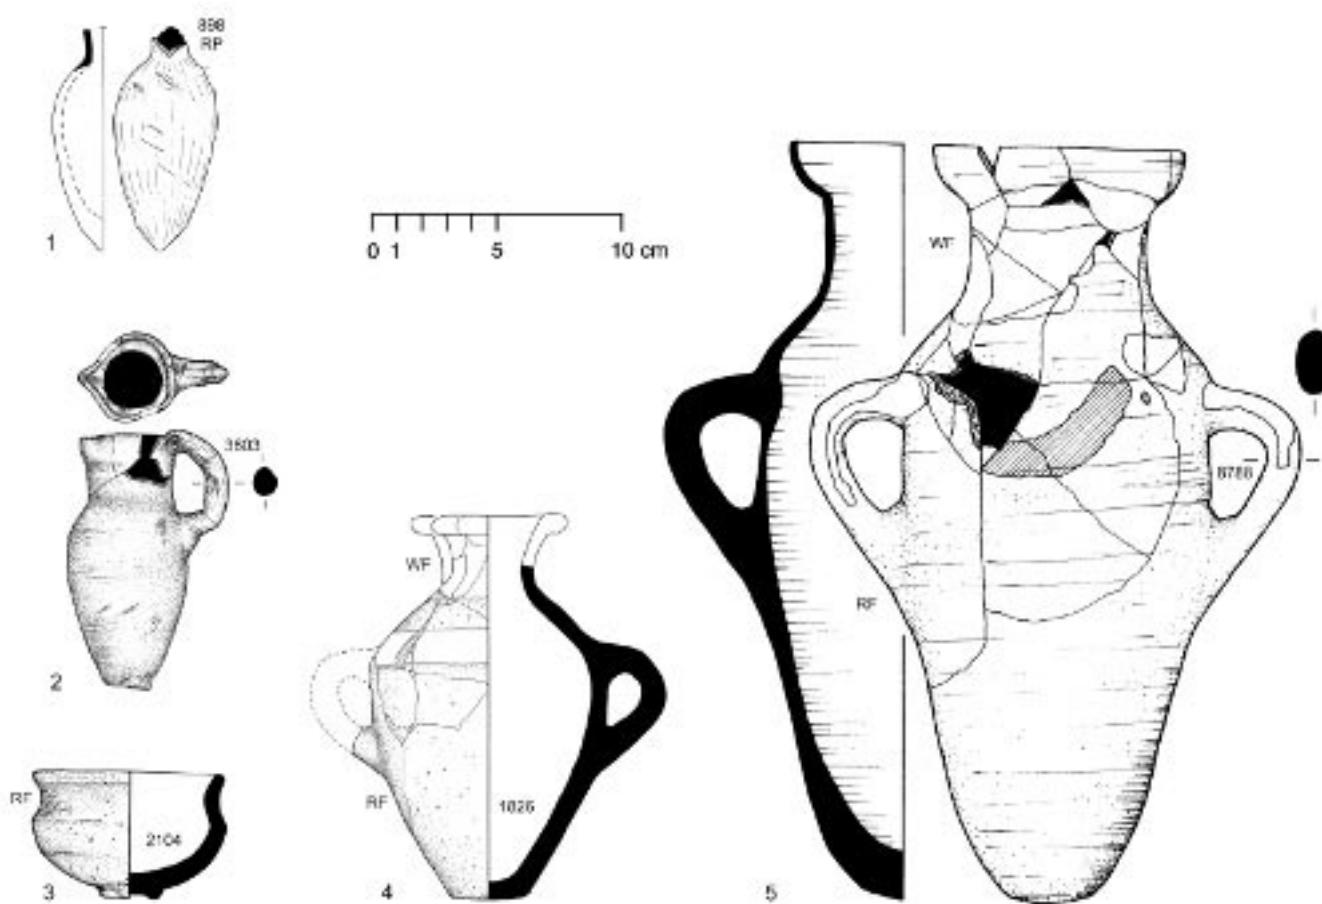

Fig. 26 Miniature vessels

ble parallels come from Jericho;¹³⁶ Tell el-Ajjul;¹³⁷ Tell Farah South;¹³⁸ and Gibeon.¹³⁹

Canaanite storage jars with one handle are not very often preserved in Tell el-Dab'a (Fig. 23/5). Only in some burials fragments of these vessels were found. There may have been more in the settlement, but since the size and the shape of their rims are equal those of two handled storage jars, they only can be identified by the different position of the handle on the body. All examples were imported to the site from the beginning of the MBII period onwards. Parallels can be found all over the Syro-Palestinian region.

CANAANITE JARS

In the Hyksos period, Canaanite storage jars (Fig. 24) do not show the variations in fabric and shape that they did in earlier times. In many cases the fabrics are made from a very sandy clay. Many belong to the Tell el-Dab'a fabric group IV-1, which defines a very dark reddish clay with crushed limestone or shell particles added. Others are ascribed to group IV-2, which unifies many different groups from beige to orange to brown firing clays.¹⁴⁰ Hardly any imported jars of group IV-3 can be observed. In this group, all the white to light beige and grey firing fabrics are concentrated, with their origin lying possibly in different areas in Syria and parts of inland Palestine and Jordan. Preliminary results of the petrographic analysis of the Canaanite storage jars of the Hyksos period point to the Northern Palestinian or Southern Lebanese coast.¹⁴¹ The same origin is suggested for an over-sized handleless storage jar (height over 70cm) with a flat base and horizontal combing around the shoulder (Fig. 24/6). It has been reused for a child burial at the end of the Hyksos period.¹⁴² Complete jars of

this size, as well as handleless storage jars are very rare at Tell el-Dab'a and come mainly from burials.¹⁴³ As mainly rim, handle, base or wall fragments are found in the settlement it is rarely possible to reconstruct a complete profile of these jars.

The reduction in the variations of the fabrics of the storage jars hints to a smaller group of trading partners and/or sources of imports.

In Avaris, they were used in daily life as well as in cultic connections or as burial goods.

PITHOS/CRATER

The body fragment of a huge pithos or crater (Fig. 25) was found in secondary use. It is part of a child burial from the end of the Hyksos period¹⁴⁴ and was covering the burial. This container was imported to the site and decorated around the max. diameter with a herringbone pattern. This is later found on pithoi, craters, offering stands and cooking pots throughout the whole Syro-Palestinian region. One possible parallel for the Tell el-Dab'a piece can be seen in a huge crater from an MB tomb of Jericho.¹⁴⁵

MINIATURE VESSELS¹⁴⁶

Miniatures of different vessel types, whose origin is either Egypt or the Syro-Palestinian region, were manufactured for cultic purposes in Tell el-Dab'a. Only one normal to model size large Canaanite storage jar (Fig. 26/5) was imported. It was found as a burial good in a tomb of str. D/2. Traces of white and red paint appear on the neck, the shoulder and the handles. A similar kind of decoration shows the model of a storage jar made in I-b-2 clay (Fig. 26/4), coming from an offering deposit of the early Hyksos period.¹⁴⁷ Models of Canaanite storage jars can be found in favissae in

Ugarit;¹⁴⁸ the “offerandes de fondation” in Byblos;¹⁴⁹ and in the cultic deposit from Nahariya.¹⁵⁰

Tiny dipper juglets¹⁵¹ with round handles, V-shaped bases and red burnishing (Fig. 26/1), similar to their larger versions of this period, appear in tombs and offering pits. They are manufactured of I-d and I-b-2 clays. Nearly all the unslipped models of dipper juglets with round handles and either round or flat bases (Fig. 26/2) were found at the big temple offering pits. Parallels come from Lachish;¹⁵² Nahariya;¹⁵³ and possibly Byblos.¹⁵⁴

A model of a carinated bowl (Fig. 26/3) made of I-b-2 clay and covered with a red wash is, unique for Tell el-Dab'a so far, but more common in the Syro-Palestinian region. It was found in a robber's pit, which was dug into an earlier Hyksos tomb in the necropolis area A/II of Tell el-Dab'a¹⁵⁵ and belongs either to the tomb or a nearby offering pit. Models of carinated bowls have also been found in Nahariya¹⁵⁶ and Byblos.¹⁵⁷

CONCLUSIONS

Tell el-Dab'a, situated on the easternmost of the main branches of the Nile, was the trading link between inland Egypt and the Ancient Near East during the MBIIA period. During the MBIIIB period it rises to become the most important city of the Hyksos culture. The dimensions of the area inhabited by the carriers of this culture are quite restricted from a geographical point of view, but the Hyksos could rely on a widespread trading network, which had been built up and used already by their predecessors. From the

late 12th dynasty onwards, nearly all the external trade of Egypt must have gone through the harbours of this city. This can be seen in the abundance of imported goods in Tell el-Dab'a itself, as well as in the decrease of their appearance upstream the Nile valley. With the beginning of the Hyksos period this trading stopped as well as the import of Upper Egyptian goods into the north-eastern Nile Delta. From an archaeological point of view, the expansion of the Hyksos territory is restricted to Tell el-Yahudiyeh in the South, Tell el-Maskhuta in the Wadi Tumilat and Tell Hebwa¹⁵⁸ at the entrance to the Northern Sinai in the East. How far this culture spread into the Middle and Western Nile Delta is still unknown. Apart from some surveys, these areas are archaeologically unexplored for the periods ranging from the late 12th dynasty until the New Kingdom. The fact that since the beginning of the Hyksos time nearly no imports from the Near East reached Upper Egypt suggests that the Hyksos may have had control over the whole Nile Delta. The textual evidence that the Hyksos ruled their kingdom with Memphis their capital,¹⁵⁹ can not be verified by archaeology at this point. The pottery found at Kom el-Rabi'a/Memphis¹⁶⁰ continues the tradition of the 13th dynasty's former capital It-tawy and bears only little resemblance to the material of Tell el-Dab'a in the Hyksos era.

The theory that after the conquest of Avaris, at the beginning of the 18th dynasty, the Hyksos retreated to either Tell el-Ajjul, Tell Farah-South or Tel Haror, all of which have been proposed to be identified with ancient Sharuhene, cannot be support-

ed by the ceramic material. The material remains of the carriers of the Hyksos culture and those of the MBIIB/C culture in southern Palestine are simply too different. The pottery finds in Tell el-Dab'a suggest a continuous pottery tradition and steady development of shapes appearing in the N.K. layers rather than an abrupt end of the settlement. It seems as if not the local population changed their place of living, but that the ruling class moved instead. The ancient texts of the 18th dynasty, which inform us about the expulsion of the Hyksos might refer only to a part of the inhabitants of Avaris, as M. Bietak has already suggested,¹⁶¹ perhaps the ruling class, but not the majority of the carriers of this culture.

While at the beginning of the Hyksos time sporadic imports reached the site, these imports were reduced to non-existence over the years, with the exception of Canaanite storage jars, which are imported to Tell el-Dab'a during all periods. A strong influence of the MBIIB pottery, mainly of the northern Levantine region, as well as from the central and northern inland of Palestine and the Jordan valley was always noticeable. The direct trade between Tell el-Dab'a and the north can be proven in part by the Canaanite storage jars, whose petrographic analysis by A. Cohen-Weinberger shows an origin from the northern Israeli/southern Lebanese coast as well as by the aforementioned influences from the MBIIB pottery of the Syrian-Lebanese and northern inner Palestine/southern Beqaa regions on the MB shapes of Tell el-Dab'a. Most likely, an integration of the latter areas into the trading network leading to the Levantine coast was responsible for the indirect contact to Tell el-Dab'a. The trade in the opposite direction, from Tell el-Dab'a to the northern coastal cities, may be sporadically visible. On a plate of *Byblos et l'Égypte* P. Montet published vessels of which at least three may have originated in Egypt. Two vessels illustrated

amongst the finds from the "tombeaux II, III, IV, VII et VIII et tombeaux de particuliers" show Zir types of the Hyksos period¹⁶² and of the early 18th dynasty.¹⁶³ The Hyksos type comes from the royal tombs I–III¹⁶⁴ and is equipped with an everted rim, which is folded to the outside and has a small flat base. This base dates the Zir into the middle of the 13th dynasty as in the Hyksos phases this type shows a round base.¹⁶⁵ The second depicted Zir from Byblos is chronologically most likely to be placed between a Zir from Mayana¹⁶⁶ in the late 17th dynasty/early 18th dynasty¹⁶⁷ and the one found in Tell el-Dab'a area A/V in a pit of the New Kingdom, which cuts into the Second Intermediate Period layers.¹⁶⁸ Another jar from Byblos¹⁶⁹ shows an everted and horizontally trimmed rim, a rounded biconical body and a round base. Unfortunately the outside of the rim is not clearly visible, thus, two rim types are possible: either plain¹⁷⁰ or corrugated on the outside.¹⁷¹ Both exist in the late Hyksos layers but last into the New Kingdom.¹⁷²

The contacts to the Palestinian hinterland and the Jordan valley present different problems. Most of the parallels come from the Jericho tombs, which may be explained by the fact that Jericho is one of the best published sites in Palestine. It is important to note that these parallels are also rare in the ceramic corpus of Jericho, which leads to the suspicion that they were imported to this site also.

While most of the parallels to the northern regions come from settlement contexts, in inland Palestine this is only the case in the more recent excavations of Lachish and Shechem. In these cases, a connection on the basis of the MBIIB pottery can be stated, but it is very difficult to track down an overland trading route heading to the north-eastern Nile Delta. E. Oren referring to survey material of the Middle Bronze Age from the Northern Sinai¹⁷³ claims this to be the trading bridge between the Eastern

Nile Delta and Southern Palestine, however the material supports his theory only in certain periods. The depicted Egyptian pottery¹⁷⁴ includes vessels that exist at Tell el-Dab'a from phases N–G/4, the layers of the 12th and early 13th dynasty, as well as material that can be found in phases of the late Hyksos period as well as of the 18th dynasty.

All the Southern Palestinian cities reflect a similar picture regarding their connection to Tell el-Dab'a. In the city of Ashkelon, parallels can be found only in the groups of the Tell el-Yahudijeh juglets,¹⁷⁵ being imports from Cyprus and occasionally from Egypt.¹⁷⁶ It is possible that the latter arrived in Ashkelon also via sea trade.¹⁷⁷ The material from the recent excavations at Tel Haror draws a very similar picture.¹⁷⁸ Here, also, the parallels to the pottery corpus of Tell el-Dab'a are very limited. The same is true for Tell Hesi.

In the case of the old excavations at Tell el-Ajjul¹⁷⁹ the following picture emerges: the first built *Palace I* dated by the excavator W.F.M. Petrie into the period of the 6th to the 8th dynasty, was put by W.F. Albright into the time of the 15th to 16th dynasty.¹⁸⁰ The pottery found in this palace indicates an even later date, i.e. the period of the early 18th dynasty. In the wall MT and the room OH, the rims of early 18th dynasty Marl zirs¹⁸¹ have been found in the lowest levels. In his reinvestigation of the fine and imported wares of Tell el-

Ajjul R.S. Merrillees¹⁸² identified sherds of White Slip I and Base Ring I ware, that date into this level. C. Bergoffen draws the same conclusion in her recent studies on the Proto White Slip and White Slip I Pottery from Tell el-Ajjul.¹⁸³ These results in combination with the Egyptian zir fit well with the first appearance of White Slip I sherds in the early 18th dynasty levels of Tell el-Dab'a.¹⁸⁴

Several questions arise in the light of this “not so close” relationship between the north-eastern Nile Delta of the Hyksos and the Southern Palestinian cities of the MBIIIB–C: Were the heavy fortifications documented in these cities¹⁸⁵ built to support the Hyksos territories or to oppose them? And if they belonged to the Hyksos dominion, why did they not spring to arms to support the Hyksos in their war against the uprising Theban dynasty? No help from this region is attested in any of the ancient records.

The main sources for the political and military activities of the early 18th dynasty are the autobiographies in the tombs of the navy captain Ahmosis sa Ibana from El-Kab,¹⁸⁶ the soldier Ahmose Pen-Nekhbet,¹⁸⁷ the court astronomer Amenemhet¹⁸⁸ and the annals and topographical lists of Thutmosis III.¹⁸⁹ None of them mentions heavy military activity in Southern Palestine. It seems, however, that the kings of the early New Kingdom were very active in the regions further north. As Helck¹⁹⁰ has

¹⁷⁴ *Op. cit.* fig. 276, fig. 8.23. This plate shows a selection of the vessels shown in the M.A.-thesis of A. GAT, *Northern Sinai during the MB II Age – Middle Kingdom – Second Intermediate Period*, Unpublished M.A. thesis, Beer Sheva 1997, 1–9 (English summary). There the same picture emerges for the Egyptian pottery, whereas one can find there also shapes which do not come up before the 18th dynasty in Tell el-Dab'a.

¹⁷⁵ These have been always seen as export goods of the Hyksos into the ancient world. But A. Cohen-Weinberger was able to proof that the so called “Egyptian group” was produced also in Palestine.

¹⁷⁶ See for this parallels: M. BIETAK, L. STAGER and K. KOPETZKY, Stratigraphic comparée nouvelle. The Synchronisation of Ashkelon and Tell el-Dab'a, figs. 3 and 4.

¹⁷⁷ E.S. MARCUS, *Maritime Trade in the Southern Levant from Earliest Times through the Middle Bronze IIa Period*, Ph.D.-thesis, Oxford 1998, 102, suggests the Gaza region as a possible first landing point for ships leaving Tell el-Dab'a on a maritime trading route to Byblos.

¹⁷⁸ I want to give sincere thanks to E. Oren for his freehanded access to the unpublished material from Tel Haror, which I was able to see unlimited.

already suggested they had to follow in the footsteps of the Hyksos and most probably wanted to legitimate their rule over these regions. On the Kamosis stela, the Hyksos king Apophis is called the “champion of *Rtnw*”. Much has been said and written about the geographical position of *Rtnw*. Even if the different authors could not agree with its exact geographical position, all have agreed that it is not the direct northern neighbour of Egypt. The successor of Kamosis, king Ahmosis, seemed to have hunted in the region of *Kdm*,¹⁹¹ an area which is mentioned in the story of Sinuhe as being in the vicinity of Byblos. During his struggle with Mitanni, Thutmosis I. travelled as far as Karkemish on the Euphrates river and either he himself or his successor hunted elephants in Nija.¹⁹² Thutmosis III. led his first warfare against the prince of Qadesh and the princes of the Upper *Rtnw*. Thutmosis' III. famous “Megiddo list”, depicted on the 6th pylon of the great Amun temple in Karnak, consists only of places to the north of Jaffa.

It is obvious that the early 18th dynasty tried to secure their influence in the areas of northern Palestine and Lebanon before they focused their attention on Southern Palestine. Most probably Egypt felt that its political and economic interests in the northern areas needed to be protected or secured, especially considering the danger of a possible incorporation of these areas into the Mitanni Kingdom or the rising Hatti Empire. If Egypt feared that by destroying the Hyksos empire a political vacuum might arise, it was surely *the* power who knew how to act and where to intervene and the early 18th dynasty kings moved immediately north.¹⁹³ This leads to the conclusion that the northern regions of Palestine and Lebanon were more closely connected to Hyksos Empire than to southern Palestine. For the latter it seems as if from there, beside some minor incidences, no direct

threat for 18th dynasty Egypt was to be feared. Perhaps the southern Palestinian cities were already before the expulsion of the Hyksos, not hostile to the kings of Thebes, which would mean they could not have been in a political or military alliance with the Hyksos. The difference in the material culture of the Hyksos and the southern Palestinian cities during the time of the Second Intermediate Period changes with the beginning of the 18th dynasty. From this point onwards more and more Egyptian or egyptianized goods can be found. This can be observed in the coastal towns of Tell Ajkul and Ashkelon.¹⁹⁴ It might also explain the phenomenon of the overland trading route between Egypt and Palestine via the Northern Sinai. Because the characteristic Hyksos pottery is missing in the southern Palestinian cities one might conclude that the beginning of the 18th dynasty was the point at which this trading bridge gained importance once again.

This raises questions, where about exactly Sharuhene was located; and if it belonged to the Hyksos territories; or if the city only hosted refugees from this area and was therefore besieged by the Egyptians. The fact that it took 3 years to conquer the city supports the theory that it belonged to the Hyksos territories or at least was politically and militarily strongly affiliated with them. Was it therefore possible that Sharuhene was situated amongst those cities which seemed to have a restricted contact with the Hyksos? Or must one consider about the idea, seeking Sharuhene in another geographical surrounding?

New archaeological investigations along the Levantine coast, including the recent excavations of Ashkelon and Sidon, will hopefully uncover more material, which might shed more light on the origin of the Hyksos, their trading partners and possible allies, their demise and the political influence of the early 18th dynasty in this region.

¹⁹¹ H. CARTER, Report on the Tomb of Zeser-Ka-Ra Amenhetep I, discovered by the Earl of Carnarvon in 1914, *JEA* 3 (1916), pl. XXI/7.

¹⁹² K. SETHE, *Urk IV*, 103–104.

¹⁹³ The Egyptian imports of the latest Hyksos time and more

probably of the very early 18th dynasty from Sidon and Byblos might indicate this.

¹⁹⁴ Egyptian Imports have been found in the multiple burial caves of the late MB II and the early LBI. This information I owe to Jill L. Baker and Lawrence Stager.

CATALOGUE

Tell el-Yahudiyeh Juglets (Fig. 3)

1. (8782) KRUG, piriform–bikonisch, unvollst., Teile der Wandung fehlen (TD)

Fundort: A/II-o/14 Grab 43, Best. 1; Str. E/1
