

Supplementary material

Supplement to: Arsenović, D., et al.(2024). Impact of urban outdoor thermal conditions on selected hospital admissions in Novi Sad, Serbia. *Vienna Yearbook of Population Research*, 22.
<https://doi.org/10.1553/p-m53z-m2eh>

Table S.1 Summary statistics for daily weather variables in Novi Sad, Serbia (2016-2017)

Variables	Mean	SD	Min	P25	P50	P75	Max
PET	12.20	10.23	-16.47	5.03	11.60	20.67	33.49
Humidity	69.6	17.65	30.45	55.05	68.47	83.85	100.0
Wind	0.71	0.63	0.13	0.44	0.63	0.89	3.05

Note: P25=25th percentile; P50=50th percentile; P75=75th percentile.

Figure S.1 Average daily physiologically equivalent temperature (PETAverage), relative humidity (RHAverage) and temperature (TaAverage) in Novi Sad, 2016-2017

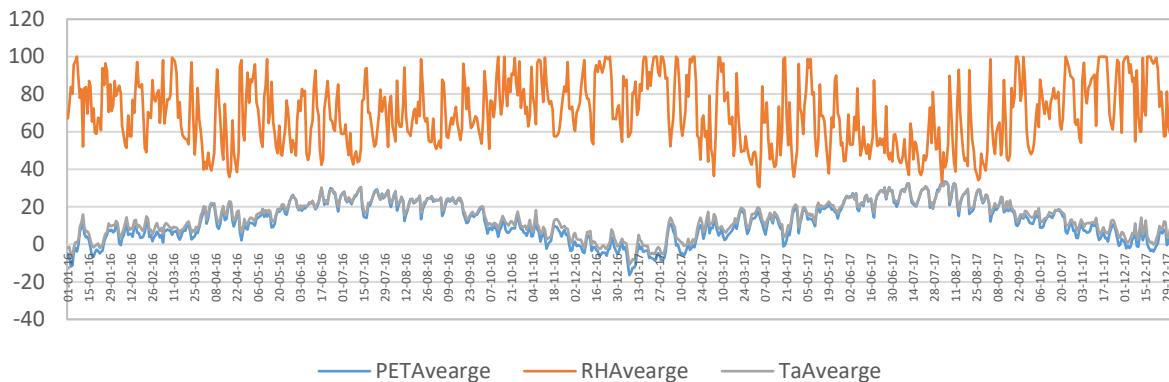

Table S.2 Cumulative effect of low and high PET on cardiovascular and respiratory hospital admission, by gender in various lag structure, Novi Sad, Serbia (2016-2017)^{a,b}

Gender	Lag	Extremely low PET RR (95% CI)	Moderate low PET RR (95% CI)	Moderate high PET RR (95% CI)	Extremely high PET RR (95% CI)
<i>Cardiovascular admission</i>					
Total	Lag 0	0.823 (0.713,0.950)	0.890 (0.824,0.961)	1.041 (0.936,1.158)	1.023 (0.897,1.167)

^a Extremely low (PET=11° C): 1th percentile of PET

Moderate low (PET=-5° C): 5th percentile of PET

Moderate high (PET=28° C): 95th percentile of PET

Extremely high (PET=32° C): 99th percentile of PET

^b Bold values indicate statistical significance at level <0.05.

Figure S.2 Cumulative effects of PET (using PET=6° C as reference value) on hospital admission due to respiratory disease over various lag structure

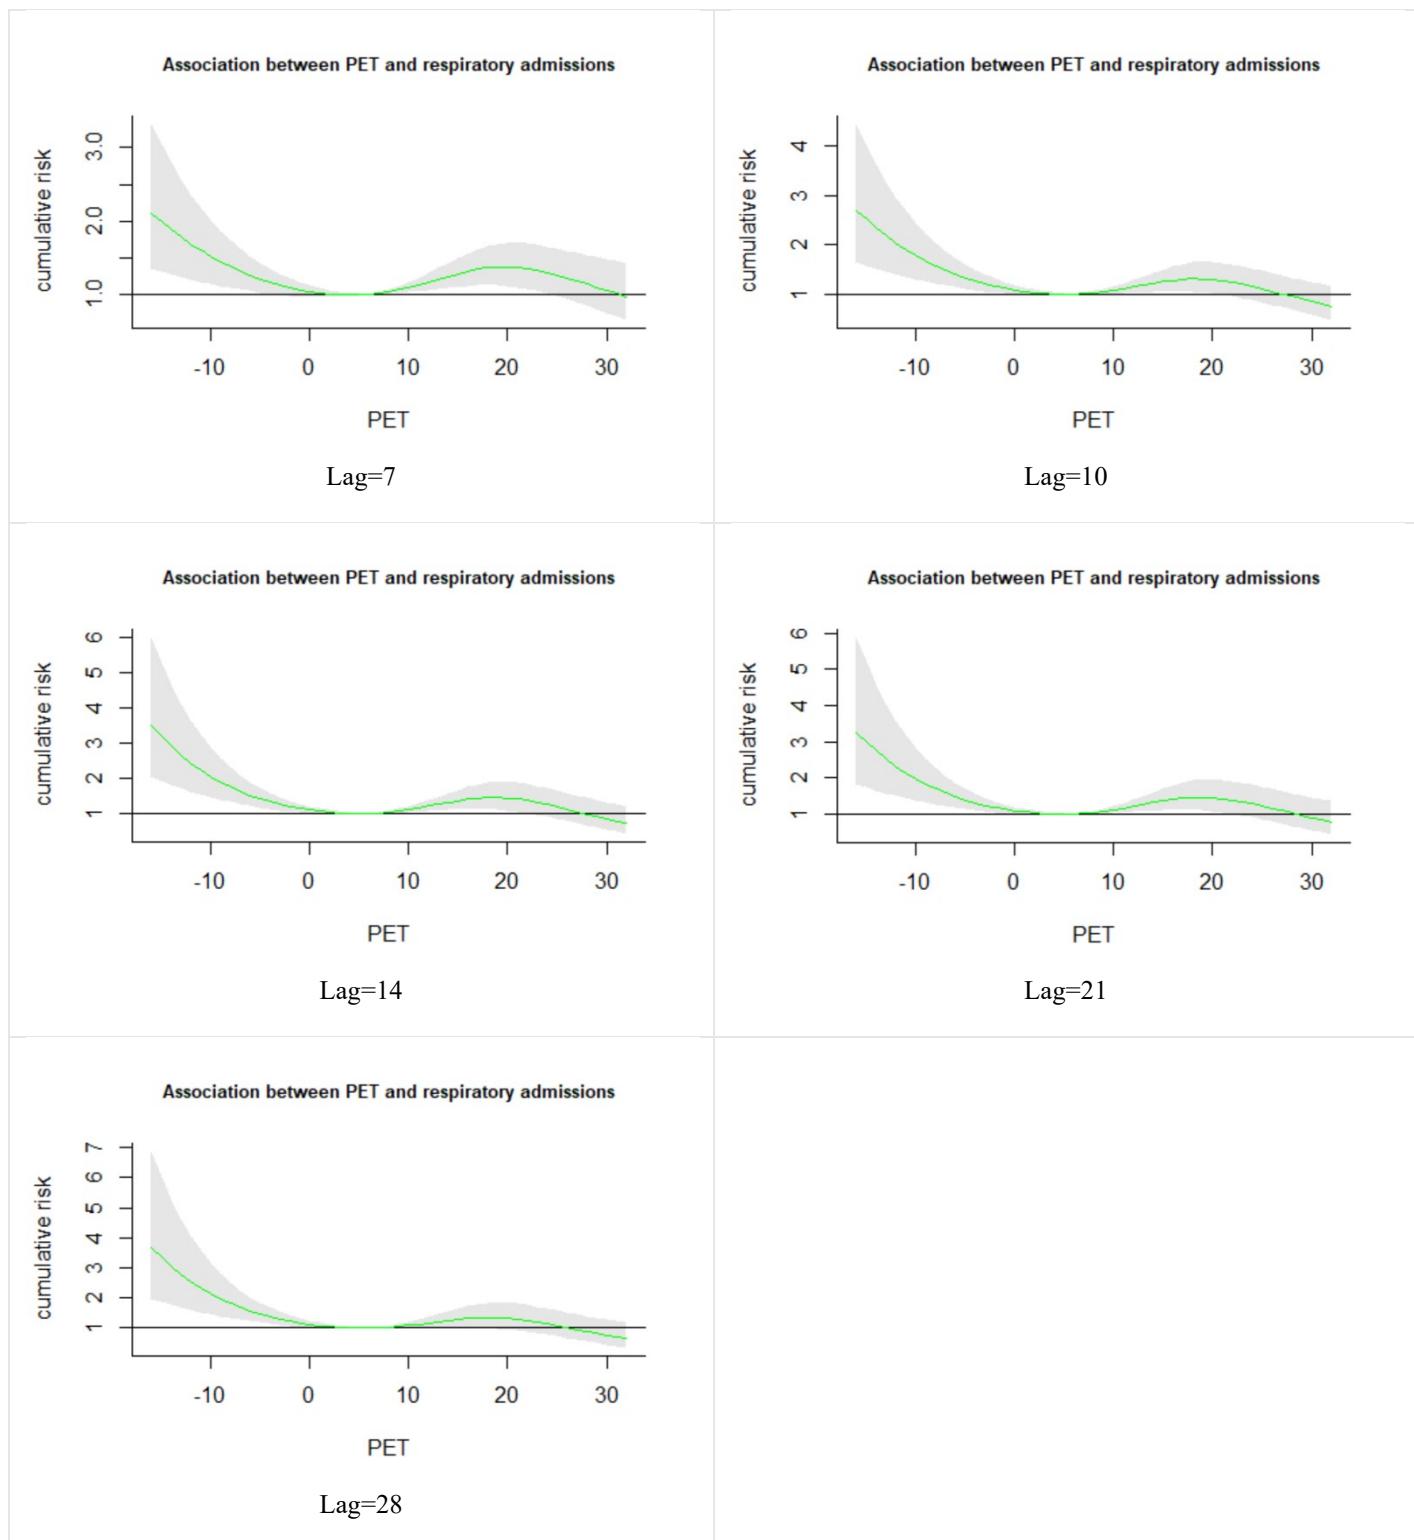

Figure S.3 Relative risk of hospital admission (both, cardiovascular and respiratory observed as one) with PET (using PET=6 °C as reference value) and various lag structure

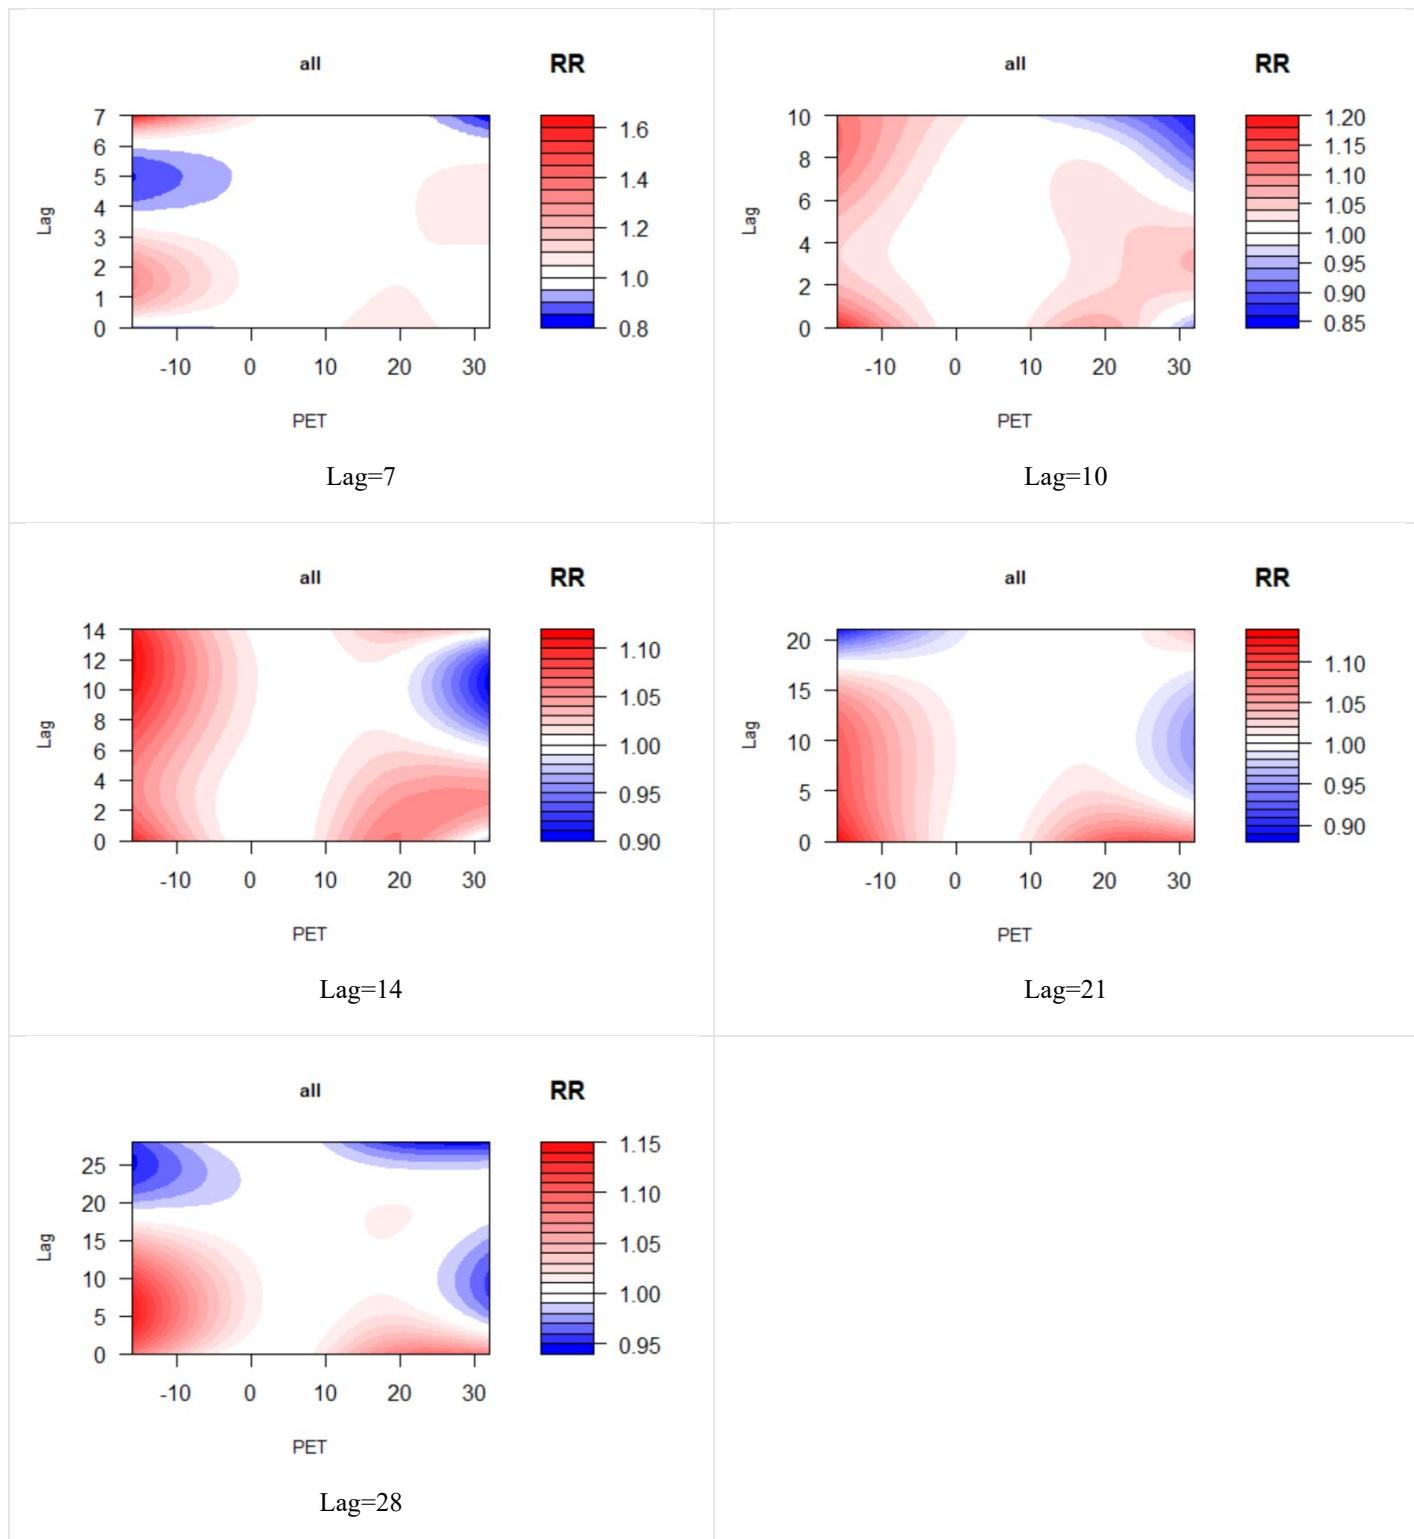

Figure S4 Cumulative risk (lag=14) of hospital admission due to respiratory disease with PET under changes in degrees of freedom (dfs) and degrees of polynomial (dpl)
