2. NEW DATA ON THE MONASTERY OF MOUNT NEBO IN THE EARLY ISLAMIC PERIOD

The stratigraphic survey conducted on the presbytery of the basilica and in room no. 103 of the monastery has returned a large group of pottery sherds, which stand out for their chronological homogeneity linked to the Umayyad period and to the early Abbasid one. Considering this important chronological context, connected to the last phases of the monastic complex and its abandonment, a specific in-depth study on the types of pottery that have come to light becomes necessary (Fig. 85).

Without going over the history of the excavations, it has to be remembered that the finds from the first excavation campaigns directed by S. Saller were presented only through a selection of photographs and brief references in the text, but without an accurate study of the stratigraphic sequence of reference236. This circumstance has unfortunately contributed to the loss of a great deal of information about the later contexts. Indeed, the abandonment phase was considered on the basis of an imprecise chronology diffused at that time and it was dated to the end of the Byzantine period (early 7th cent. A.D.). The pottery finds identified by S. Saller were the object of a typological study by H. Schneider, which was published in the third volume of the series dedicated to the excavation of Mount Nebo237. The archaeologist’s attention, addressing a morphological examination of the shapes, concentrated on the division of the vessels into functional categories, indicating the rooms of origin of the material, but without providing any precise chronological reference238.

The continuation of the excavations in the archaeological site, directed by V. Corbo, M. Piccirillo and C. Pappalardo, was mainly aimed at the lower levels of the church and some external areas, which mostly presented frequentation in the Byzantine period239. Pottery referable to the Umayyad period came to light during the archaeological survey of a portion of room no. 56 in July 1987 by a mission from the University of Florence240. These finds are relative to the last phases of frequentation when, probably due to the earthquake in A.D. 749, the occupation of the site had to be limited to only the areas closest to the basilica.

The recent surveys addressed to the monastic church and room no. 103, do not yet allow an exhaustive interpretation of the nature of the archaeological contexts and of the chronology of the monastic rooms, however they are witnesses of an activity of reconstruction during the period of transition from the Umayyad period to the Abbasid one. This is clear from the sample of pottery typologies identified in these surveys which has allowed tracing back shapes known in circulation in the central part of the province of Arabia between the 8th and the beginning of the 9th cent. A.D. The samples of the shapes, decoration and pottery fabrics are fully part of the typology known as creamy ware and Balqa ware241.

237 Schneider 1950.
238 Vanni Desideri 2012, 302.
239 Especially the south-eastern wing of the monastery.
240 In particular referred to the most recent layers of room no. 56, when, as this wing of the monastery was no longer in use, considerable levels of waste from the summit of the mountain accumulated inside the room. See phase VI in Vanni Desideri 2012, 309–331.
241 The most important diagnostic examples of the diocese of Madaba come from the sites of Umm er-Rasas and Nitl. See in this regard Alliata 1991, Pappalardo 2002, Hamarneh 2006.
Fig. 85 Memorial of Moses. Plan of the monastery showing the *loci* excavated (drawing by G. MICALIZZI and C. PUGLISI).
Contemporary with these pottery fragments is the fairly homogeneous set found in the excavation of cistern no. 8 standing in the centre of the atrium in front of the basilica’s façade. The pottery, made up of large-sized pieces, which in many cases could be reconstructed, has been studied here because it is still unpublished and it presents the characteristics of fabric and shape typical of the period under examination.

These data allow the monastery standing on the summit of Siyagha to be put into relation with other monastic complexes in the surrounding valleys, in particular with the finds from the monastery of Theotokos in the Wadi ‘Ain el-Kanisah.

The study of the pottery was preceded by the digitalization of all the previous ceramological documentation in a new online data base, conceived by the restorer M. Chorosiński. The relational database of Mount Nebo is of the MySQL type and allows the information about the finds from the archaeological excavations in the monastic complex to be digitally stored. The objective has been to create an interface that would allow the connection of tables containing the various data, thereby making it possible for a user to add new items to the fields or to modify the existing ones. The command of the search function allows detailed data from the different tables to be recovered and listed all together. The database also includes a couple of scripts on the homepage to which a general map of the site is connected. By clicking on one specific sector of the Mount Nebo complex, it is possible to list all the items relative to that specific place. The examination of the pottery fragments has followed the same methodological premises shown on page 86.

The survey in the southern wing of the monastery has also affected the cleaning of room no. 90 and of room no. 89 to photographically document the channel and basin mentioned by S. Saller (Figs. 86–87).

---

243 Saller 1941, 176–178; 185.
The archaeological surveys carried out in the southern sector of the monastery were motivated by practical necessities relative to conduits for the new electrical system of the basilica. The excavations thus allowed deeper reflections on the final phases of occupation of the monastic complex (Figs. 88–89).

Room no. 103, inspected at a superficial level in the years 1933–1935, was identified by S. Saller as a lobby between room no. 105, containing an oven, and room no. 101. The presence of two other ovens in room no. 93 had suggested that the archaeologist recognize in this section the productive area connected with the dietary needs of the monastery. This hypothesis was confirmed by the new finds during the latest investigations.

After having cleaned the room of the modern accumulation, the filling was identified, made up of irregular stones, probably attributable to work done by V. Corbo in 1964, during which some rooms of the monastery were filled. In the layer SU.M1031 some out of context pottery fragments were identified (Pl. 23). Continuing the excavation, SU.M1032 was found at −1 m from the initial level, made up of an even yellowish layer with numerous traces of ashes which extended uniformly over the whole surface of the room (Pl. 24). The removal of this SU allowed the identification of a paving SU.M1033 in the northern portion of the room, the same as already identified in S. Saller’s excavation (Fig. 91–92). In the southern portion of the room, the foundations of a wall with an east-west orientation (SU.M1034) were identified, parallel to the external perimeter wall of the room, and an embankment of irregular stones SU.M1035 (Figs. 90, 93).

When the paving was eliminated, an oven (SU.M1036), like those excavated in rooms in nos. 105 and 93, was found (Figs. 94–95). The middle-lower portion of the structure is kept with a depth of 85 cm and a diameter of 150 cm. The clay walls are about 4–5 cm thick. The excavation of the oven has returned two layers full of archaeological material from the Umayyad era (SU.M1037 and SU.M139) (Figs. 96–97; Pls. 25–28) spaced out by a compact layer of red earth and ashes SU.M1037.

2.1.1 Catalogue of finds

**SU.M1031 (from the surface; filling mainly made up of stones, building waste after Corbo 1964) (Pl. 23)**

2. MN-103-A-12 Wall of vase. Very fine fabric; colour: pinkish; traces of fine beige slip; strong firing. Decoration probably made of circles or spirals in a dark red colour.
3. MN-103-A-14 Pitcher. Fine fabric; Diam. 10 cm; colour: beige; strong firing. There is a decoration made up of a continuous series of short signs on the edge of the vessel and a sinuous band which is developed on the neck of the vessel; the decorations are painted in dark red.
5. MN-103-A-7 Jar. Granular fabric; Diam. 36 cm; colour: pinkish; beige slip; strong firing.

**SU.M1032 (at ca. −1.00 m from the surface; yellow beaten soil with ash) (Pl. 24)**

1. MN-103-B-1 Basin. Granular fabric; Diam. 28 cm; colour: pink; beige slip; strong firing. There is a decoration made up deeply engraved comb-like lines.
2. MN-103-B-2 Basin. Granular fabric; Diam. 24 cm; colour: beige; greyish slip; medium firing.
3. MN-103-B-9 Jug. Granular fabric; Diam. 12 cm; colour: reddish; beige slip; medium firing.
4. MN-103-B-10 Plate (?). Granular fabric; Diam. 26 cm; colour: light brown, dark brown slip; strong firing.
5. MN-103-B-5 Bottom of pot. Granular fabric; colour: pinkish; strong firing. Externally darkened by fire.
6. MN-103-B-14 Vessel wall decorated with red paint. Fine fabric; colour: pinkish; beige slip; strong firing.

**SU.M1037 (emptying of oven, under the paving) (Pls. 25–27)**

1. MN-103-I-3 Jug. Granular fabric; Diam. 10 cm; colour: pinkish; beige slip; strong firing. Dark red paint.
2. MN-103-I-18 Jug. Fine fabric; Diam. 8 cm; colour: pinkish; light slip, red paint; strong firing.
3. MN-103-I-61 Handle in two pieces. Fine fabric, small white inclusions are present; colour: pinkish, brown nucleus; beige slip; very strong firing.
4. MN-103-I-30 Handle and wall. Fine fabric; colour: pinkish; beige slip, dark red paint; very strong firing.
5. MN-103-I-40 Vessel wall decorated with red paint. Slightly granular fabric; colour: brown; black slip; strong firing.
7. MN-103-I-42 Vessel wall decorated with red paint. Fine fabric; colour: pinkish; beige slip; strong firing. The decorations are made up of plant volutes and spirals.
9. MN-103-I-62 Cup. Very fine fabric; Diam. 9.5 cm; colour: pinkish; beige slip; strong firing. Decoration that develops on the shoulder of the vase made up of geometric marks (spirals alternating with six-pointed stars) in dark red paint applied after firing.
11. MN-103-I-7 Jug. Slightly granular fabric; Diam. 10 cm; colour: light brown; dark slip; strong firing.
12. MN-103-I-4 Jug. Very granular-quartziferous fabric; Diam. 8 cm; colour: light brown; dark slip; strong firing.
13. MN-103-I-16 Jug. Medium granular fabric; Diam. 8 cm; colour: pinkish; dark slip and signs of burning; strong firing.
14. MN-103-I-17 Jug. Very fine fabric; Diam. 10 cm; colour: beige-greenish; weak firing.
15. MN-103-I-11 Jug. Granular-quartziferous fabric; Diam. 16 cm; colour: pinkish; dark slip; strong firing.
17. MN-103-I-26 Pot. Granular-quartziferous fabric; Diam. 12 cm; colour: brown, blackish nucleus; dark brown slip; strong firing.
19. MN-103-I-29 Pot. Medium granular fabric; Diam. 10 cm; colour: reddish; dark brown slip; strong firing.
20. MN-103-I-13 Lid. Fine fabric; Diam. 24 cm; colour: pinkish; greyish slip; medium firing. Traces of darkening by fire are present.
21. MN-103-I-64 Lid. Slightly granular fabric; Diam. 20 cm; colour: pinkish; dark grey slip; strong firing.
22. MN-103-I-19 Lid. Granular fabric; Diam. 14 cm; colour: pinkish; greyish slip; string firing.
23. MN-103-I-8 Lid. Slightly granular fabric; Diam. 10 cm; colour: pinkish; dark slip; medium firing.
24. MN-103-I-22 Lid. Fine fabric; Diam. 16 cm; colour: pinkish; greyish slip; strong firing.
25. MN-103-I-16 Plate. Slightly granular fabric; Diam. 22 cm; colour: beige; strong firing.
26. MN-103-I-9 Lid. Slightly granular fabric; Diam. 18 cm; colour: pinkish; dark brown slip; very strong firing.
28. MN-103-I-5 Plate. Fine fabric; Diam. 22 cm; colour: light brown; dark slip; strong firing.
30. MN-103-I-10 Plate. Fine fabric; Diam. 28 cm; colour: brown; strong firing.
31. MN-103-I-25 Plate. Fine fabric; Diam. 24 cm; colour: beige; strong firing. The wall is twisted, perhaps a reject of production.
33. MN-103-I-20 Tile. Fine fabric; colour: pinkish, orange nucleus; beige slip; strong firing.

**SU.M1039 (emptying of oven, under compact layer of red soil and ash) (Pl. 28)**

1. MN-103-II-4 Jug. Fine fabric; Diam. 12 cm; colour: greyish; beige slip; strong firing.
2. MN-103-II-8 Jug. Granular fabric; Diam. 12 cm; colour: brown, light brown nucleus; beige slip; strong firing.
3. MN-103-II-6 Jug. Fine fabric; Diam. 10 cm; colour: brown; greyish slip; strong firing.
4. MN-103-II-12 Jug. Fine fabric; Diam. 8 cm; colour: light brown; beige slip; very strong firing.
5. MN-103-II-10 Jug. Fine fabric; Diam. 6 cm; colour: brown; beige slip; strong firing.
6. MN-103-II-11 Bowl. Very fine fabric; Diam. 14 cm; colour: brown; greyish slip; strong firing.
7. MN-103-II-7 Cup. Slightly granular fabric; Diam. 12 cm; colour: pinkish; greyish slip; strong firing.
8. MN-103-II-2 Small amphora. Very fine fabric; Diam. 15 cm; colour: pinkish, slightly lighter nucleus; beige slip; strong firing. The shoulder is decorated with a continuous spiral painted red.
9. MN-103-II-17 Small cup. Fine fabric; Diam. 12 cm; colour: reddish; strong firing.
10. MN-103-II-21 Lid. Granular fabric; Diam. 21 cm; colour: pinkish; grey slip; medium firing.
11. MN-103-II-5 Lid. Granular fabric; Diam. 22 cm; colour: light brown; dark brown slip, signs of blackening; strong firing.
2.1.2 Conclusions

The closed vessels pertaining to the contexts of room no. 103 are characterized by modest dimensions, vertical and slightly thickened lips and by thin walls which allow the supposition of domestic use. The pottery finds can be divided into two groups depending on the fabric. The first contains vessels with a medium purified fabric with whitish inclusions of small dimensions and a colour from reddish-brown to grey (Pl. 26, nos. 10, 11, 12, 13, 15, 16). The firing is strong. The second group consists of vessels with a purified fabric of a pinkish colour with outer beige slip and decoration in red paint. The walls are carefully smoothed and the firing is strong (Pl. 23, no. 3; Pl. 25, nos. 1, 2).

The cooking shapes are well attested in the layer, with a good number of pots with a short cylindrical neck with low ribbing and handles which are grafted on to the shoulder with an elliptical cross-section and often a two-ribbed ribbon (Pl. 26, nos. 17, 18, 19). Exceptionally well-preserved are the lids made with a reddish brown and medium purified fabric containing white inclusions of small dimensions (Pl. 26, nos. 20, 21, 22, 23, 24; Pl. 28, nos. 10, 11). The shapes are mainly truncated-conical characterized by the use of ribbing in relief and vent holes. No specimen has preserved the grips at the top.

The shapes for tableware include some basins of a truncated-conical shape with a raised rim or of the enlarged type, characterized by a fabric which has been little purified, with a colour from pinkish to beige, beige slip and in some cases external incised comb-like decoration (Pl. 24, nos. 1, 2; Pl. 27, nos. 27, 29). The plates, characterized by an everted rim, still follow the late Byzantine typology (Pl. 23, no. 6; Pl. 26, no. 25; Pl. 27, nos. 27, 28, 30, 31). Amongst the open shapes, for the purposes of dating, a cup without a foot of a truncated-conical shape, with carefully smoothed wall, a very fine pinkish fabric, a light outer layer with a light-coloured slip and geometric decoration with red abstract signs is of great importance (Fig. 97; Pl. 25, no. 9)\footnote{There are numerous comparisons with the site of Umm er-Rasas, see Alliata 1991, 395–396.}

The same type of decoration and fabric is attested for small amphorae and jugs of which some fragments were recovered during the excavation (Pl. 24, no. 6; Pl. 25, nos. 1, 2; Pl. 28, no. 8). These vessels belong to the so-called \textit{red-painted ware}, characterized by light, pure and well-fired fabrics, and naturally red paint\footnote{On this type of pottery, the subject of numerous studies, see at least Amr 1986; Gawlikoski 1995; Walmsley 2007, 341–344.}. The main centre of production is still unknown, but considering the area of finds, A. G. Walmsley suggests production linked to the area of the Balqa’, in particular the region north of Amman\footnote{Walmsley 2007, 342.}. The quality and diffusion of this type of pottery reached a peak in the second half of the 8\textsuperscript{th} cent. A.D., as shown by the interesting parallels that came to light in the sites of Umm er-Rasas\footnote{Alliata 1991; Alliata 1993; Sanmori – Pappalardo 1997; Pappalardo 2002.}, Tell Jawa south of Amman\footnote{Daviau – Beckmann 1994, 259–274.}, Amman\footnote{Northedge 1992, fig. 131.} and Khirbet es-Samra\footnote{Humbert – Desreumaux 1998.}. Worthy of note are some morphological modifications that concern the bottom of the vessels, which tend to prefer flat bases rather than bases with an umbilicus of the Byzantine period\footnote{Bianchi 2007, 172.}.
2.2. THE EXCAVATION OF CISTERN NO. 8 IN THE ATRIUM IN FRONT OF THE BASILICA

The cistern at the centre of the atrium, in front of the façade of the basilica, was found by S. SALLER during the archaeological campaigns of 1933–1935 and identified with the number 8 on the general plan of the monastic complex[257] (Fig. 85, 98). The excavation was carried out in September 1995 and in May 1996 under the direction of E. ALLIATA[258]. Considering the particularity of the material found, chronologically and typically related to that from room no. 103 of the monastery and the upper rows of the synthronon, it was decided to publish it here.

The structure, excavated wholly in the rock, is square in shape and measures 5.5 × 6 m with a depth of 6.60 m from the level of the atrium[262] (Figs. 100–101). Internally the cistern is made up of blocks of local stone laid in regular courses faced with plaster and by a second layer of small lateral stones[263] (Fig. 99). At the time of the excavation in 1995, the vaulted roof partially appeared intact along the northern and southern sides while the remaining part had collapsed on to the upper layers of the filling[264]. The interior of the tank, as well as the superficial rubble, showed a rich stratigraphy with archaeological material. The upper layers were rich in architectonic elements, including one intact column, a capital and marble fragments belonging to the liturgical furnishings (Figs. 103–104). These marble elements were published by A. ACCONCI in the catalogue of stone finds in the volume on Nebo edited by M. PICCIRILLO and E. ALLIATA. As they are therefore already published in the literature, it was not deemed useful to present them here again, but the reader is invited to consult them elsewhere[265]. The lower levels, on the other hand, contained pottery fragments which are analysed here and a belt buckle (Fig. 102).

[257] The cistern was seen for the first time by C. R. CONDER who mentioned it in his survey. In this regard, see Conder 1889, 155 and also Saller 1941, 77; pl. 49, 1–2; pl. 161; Alliata 1996, 394.

### 2.2.2 Conclusions

The amphorae found in cistern no. 8 show generally very pure or finely granular fabric and are of a pinkish colour with an external beige slip and very strong firing. Numerous sherds show the typical geometric and abstract decoration in red typical of the *red-painted ware* of the Umayyad-Abbasid period already recalled for the finds in room no. 103. Specimens with an incised decoration used in the Byzantine period are absent. Worthy of note is an Amphora with a very long neck and rim reinforced by a band (Pl. 39, no. 1) which finds comparison at the monastery of ‘Ain Kanisah and above all in the ecclesiastical complexes of Umm er-Rasas and Amman. The small amphorae, very numerous, show decorations with sinuous bands on the neck and on the shoulder, a slightly everted rim and handles with a hexagonal...

and double ribbed profile (Figs. 105–106; Pl. 32, no. 3; Pl. 35, no. 2, 3, 5; Pl. 42, no. 1; Pl. 43, no. 2). Morphologically the globular shape recurs and, in some cases, a slight fairing appears (Fig. 107; Pl. 39, no. 2). The ensemble of pottery from the cistern contains a specimen of a jug with the usual hole for the spout which unfortunately has been lost (Pl. 41, no. 6). As this was an important element useful for dating, considering its progressive lengthening in the Abbasid phases, particular prudence is necessary in dating. However, the morphological characteristics outlined seem to differentiate the vase from the previous Byzantine vessels, thus suggesting a dating which is ascribed to the late Umayyad period\(^{269}\). Lastly, a small miniature jug which has an exact comparison in Pella is interesting, and suggests a dating to the end of the 7th cent. A.D.\(^{270}\) (Fig. 114; Pl. 41, no. 14).

A bottle that morphologically represents a single piece in the pottery production of Mount Nebo agrees in the same type of fabric and decoration with the small amphorae described previously (Fig. 108; Pl. 37, no. 1). Amongst the drinking vessels, particular attention should be paid to a flask, preserved in its entirety, characterized by a globular body, a very fine fabric and a very accurate polishing which finds an interesting comparison dated to the beginning of the Abbasid period, from the site of Pella (Fig. 113; Pl. 31, no. 1)\(^{271}\).

As for the cooking shapes, only one pot shaped on the lathe is attested, with a fairly rounded rim with a dark coloured granular fabric (Fig. 109; Pl. 36, no. 8). Pans are totally absent. This particularity of the pottery lot is probably to be attributed to the peculiar nature of the context where they were found, a cistern, where drinking forms linked to drawing water prevail.

Among the open shapes, there are large basins of truncated-conical shape, characterized by a medium pure fabric of a pinkish-brown colour and with a light-coloured slip (Pl. 29, no. 4; Pl. 30, no. 6; Pl. 33, nos. 2, 3, 4). Highly evident incised decoration is on the walls of the receptacles. The rim, often with a brim, in one case has applied cords (Pl. 33, no. 4).

Cups form a good part of the pottery ensemble and can be divided into three distinct groups. The first comprises the small cups of a hemispherical shape with a very fine fabric and a polish tending to brown which are also found up to the Abbasid period (Pl. 32, no. 4; Pl. 38, no. 11)\(^{272}\). The second includes the cups with a truncated-conical shape, characterized by a greater depth, slightly more vertical walls and a slightly everted rim (Pl. 38, no. 10; Fig. 110; Pl. 41, nos. 10, 11, 12). These show the usual red paint on white slip, typical of the last Umayyad period as shown by the cases of Umm-er Rasas\(^{273}\), Dhiban\(^{274}\), and Jerash\(^{275}\). The last group, certainly the latest, includes a large cup with a truncated-conical shape, a very fine pinkish fabric, often a light-coloured slip and red paint decoration (Fig. 111; Pl. 38, no. 9). The find was restored in its entirety and deserves special mention for the aesthetic refinement of the decorative motif made up of a band containing a sinuous vine which forms some spirals containing bunches of grapes alternating with large lanceolate leaves. This typology is very common in the excess layers of the site of Umm er-Rasas. The dating proposed, thanks to the numerous comparisons with the material studied by E. Alliata and C. Pappalardo, situated it in the middle of the Abbasid period with a use continuing until the 10th cent. A.D.\(^{276}\).

The only oil lamp found is of the type with spirals of vine with an almond-shaped body and bottom (Fig. 112; Pl. 36, no. 11). The valves of the oil lamp are particularly crushed and the handle with a truncated-pyramidal and trapezoid shape belongs to the type called “tongue”. The

The excavation in cistern no. 8 in the atrium in front of the basilica

2.2

The fabric is of a light colour and the firing is very strong. The particularly significant decoration represents two *kantharoi* at the sides of the *infundibulum* and other plant elements. The decorative pattern has comparisons above all in the area of Jerusalem, as shown by some specimens recovered during the excavation of the Probatic Pool in the Holy City\(^{277}\) and at the site of Khirbet el-Mafjar\(^{278}\). The morphological and typological characteristics ascribe the lamp to the middle of the Abbasid period (late 8\(^{\text{th}}\) – early 9\(^{\text{th}}\) cent. A.D.) when the archaeological site was frequented at its latest\(^{279}\).
